time of someone who just started to key the PTT, a collision is the result.
(when the p-persist falls through)

So as far as i can see it, the PTT-to-RF_OUT time should be at least several
times smaller than de SLOTTIME being used on a certain channel.

The shortest packet is about 160 bits, or (including bit stuffing etc) about
25 ms data length. Adding 120 ms txdelay gives a very bad efficiency..
Of course there are a lot of the longer packets, but real-life packet
situations don't have a very high average transmission length.

Two point modulation is a well known technique (exept appearently in Japan
:-( ) but the technical impact is of course much bigger than just finding
2 points for direct fm on a rf board.

I have only one (1) modification for a PLL rig which is done with 2-point
modulation. All the others just inject the lf into the VCO.

True, but these are also covered by THIRD-PARTY traffic restrictions, and
thus are the responsibility of the originating BBS station, i.e. ANY message
comming from the outside world SHOULD be inspected by the responsible control
op! They should be rejected if the content is marginal under ALL circumstances.

|>

|> population.)

I think the real concern here isn't what some 3rd person injects into the
packet system, but rather what joe-amateur injects into the system on a
daily basis. The above discussion is somewhat of a red-herring in that
light.

The question really seems to be simple to me. If I put out a message concerning
cookie baking (this will be the "ordering pizza" of the 90's ;-) addressed
to ALLUS I know that BECAUSE of the media limitations that the recepients are

nominally amateurs(conceeding for the moment that John Q Public might see the message go by on a relay channel employing a scanner and TNC or some such..) The media (over the radio links..) can only be accessed by other licensed amateurs, so the vast majority of the time my audience MUST be expected to be amateurs. Unless the content of the message indicates otherwise, this MUST be presumed to be the case under nominal circumstances. This being the case, there is NO broadcasting as such involved. Further, if it is amateur to amateur traffic(i.e. not NTS for Aunt Betsy), then it isn't even third party under the current definition of such. (Amateur to Amateur relay isn't concidered to be third party after the 1989 rewrite!) This being the case...there isn't any problem with the standard, run-of-the-mill ALLUS message.

The ONLY place where there should be a concern is if the content of the message indicates it is in some way intended for the general public. An article indicating it is a News Release and should be passed on to the local news paper would be a good example of something that would fall into this category. Unless it something this blatant, then I don't believe there is anything to worry about.

Also consider that we've been doing this for better than 10 years now without any action by FCC. If this were a problem under the past or current rules, something would have been done about it before.

Hey everyone....

I was wondering if there is any Multi-Mode Controller software out there for the soundblaster/pro/16 sound card series or
compatibles. I know there is a SSTV TX/RX software package advertised in QST, but I;m wondering if there is any
RTTY/Packet/CW/AMTOR/PACTOR etc.. software for the SoundBlaster.....If not that, how about for one of those DSP based
soundcards or modem (ZyXel, for example) If anyone has any info, let me know....Thanks!

Lots of verbiage, debating a relatively simple issue. Here's my take on
the discussion:

The problem is simple: there are two levels operating here. You are
saying that the cookie recipe is the relevant part, that this is
'broadcasting' or whatever, and not true ham radio communications.
Other people are saying that the station-to-station packet connection
is the relevant level, and what is contained in the packet is less or
not relevant.

Here, I'm going to have to cast my vote with the station-to-station
view. Makes more sense to me.

3954. Periodic Announcement - ARRL Email Information Server (info@arrl.org)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-03 04:00:02 UTC
From: mtracy@arrl.org
Message-ID: <rec.radio.info-arrl.email.info_783835201@ve6mgs.ampr.ab.ca>
Source record: 46591
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.digital.misc,rec.radio.amateur.homebrew,rec.radio.info

Periodic Announcement - ARRL Email Information Server (info@arrl.org)

The services that the ARRL provides via the internet include the
Email Information Server and the Technical Information Service.
The Information Server is an automated mail server that gives you
access to many of information files relating to various facets of
Amateur Radio. You can retrieve any or all of these files by
sending an email message to info@arrl.org here at ARRL HQ.
Each file you request is then mailed to you automatically.

To use it, mail messages to:

info@arrl.org

Each line of the message body should contain a command as shown below.
The subject of your message is not processed and may be omitted. You
may place as many commands in a message as you want. The files you
request will be sent to you in separate messages. Only ASCII text
files are supported.

Valid INFO commands:

reply <address> (may be needed - see below for explanation)
help
index
send FILENAME (example: send prospect.txt)
quit

In the above message example, "help" retrieves a brief set of
instructions for info, "index" retrieves a list of available files
and "send prospect.txt" retrieves a text file containing information
on becoming a radio amateur.

Note to users with FTP capability: All of these files are also
available by anonymous ftp to oak.oakland.edu in the
pub/hamradio/arrl/infoserver area. Retrieve the file index.txt
in the /league sub-directory for a complete listing of available
files.

If you want to retrieve several text files with one message, use a
separate line for each "send filename" request.

Your From: field or Reply-to: field in your header should contain a
valid Internet address, including full domain name. If your From:
field does not contain a valid Internet address, the answer will not
reach you. If this is the case, then use the reply command as shown

above. When needed, this command should always be the first command in your message.

IMPORTANT: Please use the quit command in your message. This will prevent processing errors from message signatures.

PLEASE NOTE!: This is an automated system not capable of handling written requests. Any questions on the info-server or the content of any of its files should be directed to mtracy@arrl.org.

ALSO NOTE!: Do *NOT* reply to messages sent from info@arrl.org - the reply address is redirected to keep bounced messages from endlessly looping. Write a new message to info@arrl.org instead.

The Technical Information Service gives League members on the internet better access to the knowledgeable technical staff here at ARRL HQ. Questions relating to Amateur Radio and related technical topics are welcome. To use this service, send a normal e-mail message to tis@arrl.org with your question spelled out in plain english. For best service, be as specific as possible and keep your line length in messages to a maximum of 80 characters. Due to personnel limitations, priority will be given to questions from League members.

Best Regards,

Michael Tracy, KC1SX, ARRL Technical Information Services Coordinator
(e-mail mtracy@arrl.org)

Sample of files available from INFO: (There are lots more!)

Note - If you are not yet an Amateur Radio operator retrieve the file prospect (send prospect) for information on how to easily get started in this fun hobby.

Subject: 9600bd radio's ?? NOT !

-> From: joopv@etprs.phys.tue.nl ()
-> Subject: 9600bd radio's ?? NOT !

-> I am wondering if anybody did the same tests on so-called '9600bd
-> ready' transceivers. Especially the FM rigs, the allmode rigs should
-> be ok because they have a separate FM modulator, and don't use the
-> PLL for modulation.

Hi Joop,
The East Atlanta LAN, a packet experimenters group here in Atlanta, has begun operations with our first general purpose 9600 digi. While we haven't done a good statistically based RF performance test of various transcievers yet, our experience with the "9600 ready" rigs has been good - when used with a TNC that has a sound G3RUH implementation to start out with. The two factors are inexorably tied; bad modem/radio matchup; poor performance. The Paccom Sprint2 is an excellent performer in terms of low distortion in the transmitted eye to the xcvr; so is the PK232/TAPR 9600, KPC9612, and KPC Data engine. The MFJ1270 + their G3RUH implementation is just terrible. I maintain that one of the sound TNC performers noted here with a "big three" 9600 ready xcvr. will produce better-than-acceptable performance on-air.

-> And what about those turnaround times ? 120 ms is IMHO totally
-> unusable for 9600bd packet. This thing sure is going to produce lots
-> of collisions on busy channels !

Boy, are we really operating in the blind! We operate with TXD set to 22 and it performs beautifully! Based on what you say here, I'm going to cut it down to 13-15 and see how it does!

-> I am wondering if anybody did the same tests on so-called '9600bd
-> ready' transceivers. Especially the FM rigs, the allmode rigs should
-> be ok because they have a separate FM modulator, and don't use the
-> PLL for modulation.

Our experienc has born this out. I have a Kenwood TS811 which has been modified for 9600, and we kind of use it as the standard to measure other radios against. I have been trying to get the cheaper PLL modulated rigs to work for a year and a half - with disappointing results. About 3 months ago, James Miller suggested a new approach to me: try a "two point modulation" approach, wherein both the VCO AND the master reference oscillator are modulated with the 9600 audio. In this manner, the cancellation effect of the PLL is eliminated. I have even found a company, MX*COM, which makes a chipset to facilitate this approach. I haven't had time to try it, but it's on this winter's list of projects. If such an approach were to work, it would open 9600 packet to MANY, MANY hams who own run-of-the-mill FM only rigs. Any ideas here?

I look forward to your feedback, hoping that we can open this field up a lot of creative work!

Regards,
Steve Diggs, President
East Atlanta LAN

Operating from memory, I don't think all TNC's DCD lines are that useful.
Think the DCD line on a TNC-2 is litterally the front panel CD light, and
not the (more useful) connection LED.

Throw the TNC into KISS-mode and WAMPES will let you do exactly what you
are asking for, and TCP/IP, multiple users, etc. I don't know what is
provided in the native AX.25 now available for Linux but I mean to find
out soon.

From: jeffo@io.SLC.Unisysgsg.COM (Jeff Okleberry)
Subject: Computer <--> Modem <--> Modem <--> TNC

`?

I have a couple questions about using modems to commuicate between computers that I hope somebody on the net can help me with.

Here is my problem. I have a ham radio TNC which runs on a RS-232 port (Figure 1).

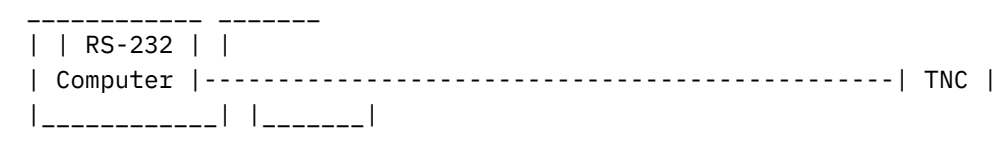

Figure 1

I have a new computer which does not have any free modem ports, but does have an internal modem. I have an extra stand alone modem and I was wondering if it is possible to use the modems so I can commuicate with my TNC (Figure 2).

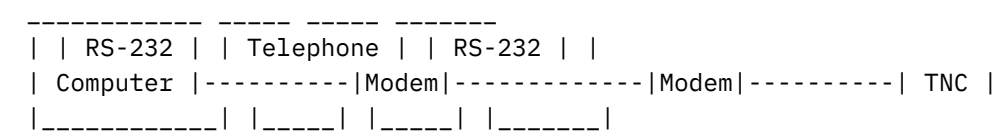

Figure 2

My second question is it possible to do the same thing in Figure 2 with two computers? A follow-on question is can I use my house's internal telephone wiring or do I need to run a direct link between the two modems?

Thank You

Jeff Okleberry

From: vaughan@belltrans.co.nz (Vaughan McPherson)
Subject: digital radio protocol

I'm currently working on a project that requires the transmission of data
over a variably unreliable medium (mobile trunked radio, half duplex). To maximise
efficency I'm fragmenting datagrams at the network layer to allow selective retransmsion.
The problem that I am faced with is the long latency between asserting the Push to
talk on the radio and the radio becoming ready to send data (~600 ms). To obtain
maximun data transmssion rates, a protocol is required that inflicts the smallest
number of transmit/recieve transitions. Does anybody know of a protocol that would
be appropiate for this situation. I could (and have) arbitrarly invented a protocol,
however it would be nice to use use some form of standard assuming any exsist.

Thanks in advance.

Subject: FTP'ing HeathKit HK-21EPROM's f

Hi! Can anybody help me out with where I might be able to FTP an update
EPROM image for my four HeathKit HK-21's that I own? I really need the
Kiss protocol etc that they don't currently have!
I am trying to set up a BBS using AmiTCP/IP and the only driver's require
Kiss!
Boy am I in diare-straight's!

The Modem's fire up with the following.

TR SERVICES TR-21
Release 1.04 08/22/88 - 32K RAM
Checksum $00
cmd:

Although they are branded TR-Services, this is just the Australian name, the
modem's are definatly identical to the Heath Kit HK-21's. THe doc's even refer
to that model with pictures etc!

Can anyone recomend any site's to FTP this sort of stuff from?

Be sure of that the threshold adjustment on the front of the TNC is
set too high, if the DCD is active the TNC will not transmit. Also
make sure that the squelch is set properly. The PK232 will not transmit
if the radio is opened squelched unless it has been modified.

it's not the network's job to be censor. that's why we have first forwarder
and station of origination rules now.

Say the word "Fido" was a bad word instead of an archetypical dog's name.

could spell it: fido, F1do, F!D0, f i d o, phydeaux, phidoh, pheyedough

xxxxx xxxxx xxxx xxx
x x x x x x
xxx x x x x x
x x x x x x
x xxxxx xxxx xxx

and so on. It becomes a game to see how many ways you can slip something by
the gatekeeper....

>For example a notice about the NY Cookie Eaters Assoc. meeting in
>Mrs Fields restaurant on 6th Avenue is a broadcast and is NG since
>it is not solely for ham use.

on the other hand if it was part of an announcement of where cookie eating
hams can go to eat cookies it would be OK. and if it wasn't an "ad"...

and since the notice would be on the bbs under the "cookie" designator, those
not wanting to know more about cookies wouldn't be bothered with it or by it.

another example...i believe the "keps" bulletins contain information about
spacecraft other than just the OSCARs. don't have to have a ham license to
receive weather fax so therefore that can't be directed at just hams, right?
(talk about twisted logic...).

When I post something (be it a mod file, or an image file, or short
program, or recipe, etc) to @WW or @USA or whatever, I anticipate that
someone out there would be interested in reading it. I do get replies
thanking me for image files (a teacher in France told me he's going to
use the "comet hitting Jupiter" images I posted in his class, which
might get some of his kids interested in ham radio maybe, another
set of replies when I posted an image of myself, all positive, no flames).

As Gary K____ (sorry, forgot your call) (the guy at a destructive test lab)
pointed out, the FCC considers all the packet posts as 3rd party traffic.
As long as you don't do something of "percunary(sp) interest" or use
dirty words, it's okay. Somewhat similar to hams on HF or 2meters

talking about the weather or health problems, in that the content is
not directly related to radios.

I've been thinking about this kind of thing a bit, and I've come
up with what seems like a very secure solution, but I don't know how
practical it would be.

Basically, the system would hinge on using PGP, or some other
application of RSAREF. The public key component would be kept on the BBS,
and the private part on the user's machine. When the user logs in, the
software could require him to sign a piece of text (perhaps the date/time
or some other thing which would change often).

The problem with this approach, of course, is its implementation.
The RSAREF source is covered under a very broad license in the US, and
could probably be implemented in a special-purpose term program without a

terrible amount of difficulty, but it wouldn't be compatible with existing
software.

3956. Help: Rexon RL-102 VHF Transceiver

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-03 05:30:28 UTC
From: simon@sdf.saomai.org
Message-ID: <CyoFAx.7GI@sdf.saomai.org>
Source record: 46737

I have a Rexon RL-102 2M Transciever which I bought in the U.K. This
works well for the 144-146Mhz frequency range. Now I am in the U.S.
I want to access up to 148Mhz, which the specification says it is
capable of. Does anyone know of a mod to change the "default"
frequency band. I know for some Kenwood models it is a matter of
entering a special code.
Replies by mail to sashdown@texas.bt.com would be appreciated as my
news feed isn't 100% reliable.
Thanks,
Simon Ashdown, G7OTJ.

>This is not really secure, since after a few weeks of monitoring, one could
>reconstruct the (secret) string, but then:

For RLI 5.x, I added a trick to provide 3 challenges:

1-2-3-4-5
10-9-8-7-6
5-8-1-9-3

... and let the operator pick one of three, and fill in the
correct response. A snooper would get 66% false responses, and
33% correct responses, and doesn't know which is which.
One is able to reconstruct the original table, but that is much
more difficult (to which challenge belongs the response?)

As far as I remember, Hank merged that in his main code.

I have not been very active in BBS development since then.

|>
|> From Part 97.3(a) ... (10) ... Broadcasting - Transmissions intended for
|> reception by the general public, either direct or relayed.

Steve, try real hard here ... read the above ... about "transmissions"
and "general public" and "intended". Give it a shot, you can probably
figure out what those words mean.

|>
|> Clearly, a BBS phone port with a annonymous check-in allows the public access
|> to relayed transmissions. There are LOTS of phone ports that allow
|> anonymous check-ins.

Wrong. It allows the public (if the sysop so chooses) access to some
files on a computer. Has nothing (zilch, zip, nada) to do with
"transmissions" or "broadcasting" or for that matter "radio", not to
mention "amateur radio".

Try really hard Steve, this is NOT rocket science.
The words really do mean just what they say. Amazing!

|> So, originators of bulletins which are sent by any means to a BBS that has
|> a public phone port that are not about amateur radio would fall under
|> broadcasting.

Would you like to run this by me again?

|> Broadcasting does not require a one-way transmission. It would appear that
|> an ax.25 connection between two stations can still be use for broadcasting.

Um, how could that happen?

Steve, you are REAL confused here. Go back to the definitions section
of part 97, and read that first. Make some notes on what the various
technical terms ("transmissions", "broadcasting", "transmitted")
mean, then read the above again.

|> (Bet we are going to move on and say that a bulletin about quilting was
|> targeted solely at the amateur population. Let me guess ... ANY bulletin
|> entered on packet is to be assumed to be aimed solely at the amateur radio
|> population.)

Ah! You have GOT it at last!

Who ELSE would an amateur station transmit this information to?
In fact, it would not be legal for an amateur station to transmit
this information to anyone BUT another ham.

By "targeted" you probably mean exactly the same thing that the FCC
means with the term "intended" in part 97.3

Simple, isn't it?

I'm still curious what you are attempting to accomplish with the
arguments you are making. What's your agenda?

... Hank

The following is a list of node parameters the I am currently experimenting with for our local node here in Escondido (San Diego, CA). I know I am leaving myself wide open for all kinds of comments in both directions, however I have to respect the great tallent pool that is present on this reflector. I would like any and all comments and opinions regarding the settings listed below, good and bad. What are your settings and particular situation for your nodes?

At this time, this is a single 2 meter node with no other prots (yet). There are a couple of neighboring nodes that I will lock in at a later date when the parms are firmed up. By the way, I am interested in the quality settings of your neighboring nodes, and why you locked them in where you did.

To view this table, you should set your screen or printer font to 10 point courier. This will prevent wrap-around in the table. I hope you can read this thing. Columns in a text file are terrible, but I did my best. :<

Column A represents the letters in the menue of the combining program.
Column B is the description
Column C is what this description is called in the program

>the channel sets their parameters properly, and hidden terminals
>still plague the system on non-repeated channels.

True collision detection requires everyone to listen to the repeater
output even while transmitting. This means that everyone should
have a set of cans as you described.
Without the listening-while-transmitting capability, a repeater
is not much better than a simplex channel (though hidden transmitters
are avoided)

Another solution is to use a crossband repeater: have everybody
transmit on 23cm and receive on 70 cm. This is easy to do
with little effort; filters are simple.

There is still a concern about harmonics. This is why I would transmit
on 23cm and not on 70 (otherwise, your 70cm transmitter's harmonics can
get in your 23cm receiver). If you reverse, then the repeater
is the only machine that has this problem & good plumbing is only
required at one spot.
For the same reason, 23cm transmitters that triple from 70cm
might not be the hottest idea..

-> I would love to see someone do as thorough a set of tests on the
-> TH-78A to see how it performs on 440 at 9600Kbd and on 2m at the
-> highest rate possible. I would like to know how this radio would
-> perform. I am willing to bet, with so many of them out there, that
-> many others would also like similar data to consider. (In other
-> words, can the radio be used for such purposes at all, at least for
-> those who just don't have the cash right now to buy another dedicated
-> radio for packet. And to put it another way as well, "Is it even
-> worth getting a 9600Kbd modem to use on it?", am I trying to do just
-> too much? Thanks for any responses that can be given.

I guess it's got a lot to do with your local packet setup, Vince. Take N. Georgia for example. We have a massive base of packet users in a small portion of the area. Out from that, you basically have rural country side for 150 miles in every direction. There are two (2) packet bbs's to serve the entire metro Atlanta area. Our main 1200 user frequency is a ZOO. Since we seem unable to develop smaller packet "communities" as the NEDA has done, we are forced to develop a more efficient way to provide access to the services we do have. We are doing that by moving users from digipeater ops. to NODE style operations, and also bringing online a new 9600 70cm. user channel. Higher data rate means more users accomodated. For us, it means the opportunity to make some sense out of this madness. We see 9600 as a new <user> connection method; others use it for backbone purposes.

We need to hear more about your local system.

Yes Cecil it will work fine...I'd suggest a slightly easier coding
program called R95...It is used pretty widely on Packet and so is the
program called 7Plus...However UUE/UUD will work fine...

Can anyone tell me the difference between the MFJ 1270C and 1270B TNCs? I am especially interested if I can simply upgrade with a ROM change. I would be further interested if anyone can help me get a copy of the 1270C ROM code. I am also interested to know if 1.1.6 is the latest firmware version for TAPR? Thanks.

The TNC doesn't have to control the modem. Once you set the modem up,
if it's a Smartmodem(tm) it'll stay that way unless the power burps,
if it's a dumb modem, it'll stay that way period.

>
>you just can't do it....the modems themselves need to have line
>voltage to "see" a carrier

No they don't. Standard modems don't use the telco battery voltage
at all. They generate tones, and decode tones, any pair of wires will
do to conduct the tones from one to the other. You don't want to use
your existing telco wiring because the moden loading will signal the
central office with an off hook condition. That'll busy your line,
and eventually drop a trouble card on your line. But there's no problem
using a dry pair to connect the modems.

Just remember that you have to initially set one modem to originate
mode, and the other to answer mode with the ATO and ATA commands.
Set carrier timeout to never, and strap DTR high on the connector.

Quite the opposite. Universal radio makes a couple of $400 decoders that
include ACARS. I own the M1200 computer plug-in card decoder. ACARS
transmissions are very encoded, however the M1200 manual spends several
pages explaining the short-hand and Universal sells an inexpensive pamphlet
that goes even further. With a little practice, you can do better than
an 80% comprehension of intercepted messages. Of course, most of the
messages are pretty mundane. Still, it is always fun to look in on something
not really intended for you. Standard disclaimers, I don't have any
relationship with Universal Radio beyond a happy customer and it sure would
be dull to invest in an ACARS decoder if you didn't live near an airport
or major air route....
Bye... Ted..

Release Notes - IM/Mac 1.0b28d

- Did not test for the availability of Desktop Manager ToolBox calls before using them.

- Scanning of the 'alias' file was in error. Two or more tabs/spaces before the '#' or ';' comment character filled your hard disk with rubbish outbound mail.

- The 'Remove' button in the 'Send to' dialog is changed to '<< Remove <<'.

- Remembers printer settings across sessions.

- When you had an 'alias' file with only one or two entries and replied to a message for which you used the return path such could generate rubbish outbound mail.

- Remembers across sessions the last used folder in 'Save As...', 'Append...', 'Decode...' and 'Send File...'. Will not attempt to mount ejected volumes.

- Did not restore screen copy after removing the 'Decode...' dialog. This left a locked handle that fragmented the heap.

- Segment 4 was not unloaded when canceling out of the 'Send...' dialog.

- Segment 17 was not unloaded when the help window was called with shift-command-?.

Experience ? Yes ..

I was looking for packet at 9600 baud on 70cm without mods required and
also with more RF power than my old rig. Well, i got the FT-5100 to
work at 9600 but it wasn't easy. The TNC connector on the rear is
only a 3,5mm stereo plug and the data-in line is also used for PTT by
pulling it down thru a resistor. Of course this works, but when you
pull PTT low there is a DC swing on the data line. It needs a long
time to settle down so i have to set txdelay to 15ms. On some days it
works very well and i catch every packet, on the next day there are lots
of retries. Interference from other stations? Bad weather?
Oh yes, and i always have to disconnect the mike for packet as it
picks up noise and spoils the outgoing packet signal.

For voice qso the FT-5100 is difficult to operate. Only one volume and one
squelch knob to set the current band. If you change between 2m/70cm you
always loose the previous setting for the right side. The squelch works
in principle, but also opens on not so strong signals. No chance to
squelch distant stations, even if turned fully clockwise.

All in all:
For voice get a rig with separate volume/squelch controls for each band
and a squelch that also works against strong interference.

For 9600 packet get a rig with a data-independent PTT line to the TNC
and that also automatically shuts down the mike input.

The FT-5100 is a disappointment and i would not buy it again.

Recently someone was experiencing RF problems using his KAM Plus.

I use two Kam Plus TNCs, one on GTOR HF and the other switching around from VHF packet to SWL monitoring. I run a pair of 2 kw amps, each with 3-500Zs in the fnals, and until I ran a new grounding system I did have a problem with RF even just using one of the Kenwood exciters.

The most common problem/solution is running the TNC off the same power supply as your transceiver. Many headaches are solved by getting rid of the wall cube power supply and purchasing a small good quality regulated supply such as the ones Radio Shack sells. Use shielded cable to make up your power cable...even braided audio cable will work.

Next use a good ground bus in the station with each item attached via either copper braid, copper strapping, or a good heavy copper content wire. This not only will help in terms of RF but for lightning safety. After having $32,000 worth of insurance claims for ham shack gear destroyed last year in a hit that came in on the AC line as well as the antenna I have learned even more than I ever wanted to know about lightning.

Finally, be sure no floating grounds exist between the TNC and either the audio in or out lines on the transceiver. In fact use seperate grounds for the two lines as an added precaution.

Once I installed these methods I no longer had any RF problems (other than that radiated by one of the ham shack computers.)

Has anyone tried the MFJ-8621 Packet Transceiver?

The November QST on PG 184 has a 1/2 pager describing the thing.
It sells for $119.00, and it says it can handle 9600 baud.

the add says it only draws 1 amp on xmit; one thing I'd like to know
is much power the thing puts out?

Oh, it works quite well, actually!

The receiver may reject a message presented during forwarding
for any reason whatsoever.

This is how the system has worked for the past half-dozen years.

(Jeff, WA7MBL first implemented it in about 1986, and all the
current BBS codes now use his method)

Steve, have you ever actually OPERATED packet and watched
what the systems are doing? Might be a good idea to spend
a few hours on air to see how it all works.

>

As am I. I receive bulletins from my feed station. The first thing it does is send "SB LOSERS @ ALLCAS < $1234_XYZ" and waits for an "OK" from me. If I alread have a copy of it (based on the bid and wars fought over that in a different thread) I send "NO" and it proceeds to try sending me something else instead.

From the questions, answers and other comments you make about this, it seems to me that you do not even have a TNC nor have you spent anytime monitoring a channel. If you have, some of this would be self evident.

Face it Steve, you've stepped on your dick. Now quietly put it back in your pants, zip up and stop asking others to come by and step on it as well.

Repeat after me: "It is NOT broadcasting."

Broadcasting as the FCC intended it to be interpratated
was to prevent the amateur radio ops from competing with
the commercial broadcasters. You know, people like KFI,
KNX, WCBS and the likes.

For those of you that must know, I forward lots of messages. All types. Personal, Bulletins and Traffic. For the others that looks at how many as a chest-thump, you don't need to know *how* many.

In addition, I forward e-mail in and out of this medium (internet and UUCP) as well. Lots.

73 es GM from Jeff

Hello Harold:

Since most CW crystals are centred about 800 HZ, it is unlikely that it will do you much good when the signals of interest are around 2200 hz. However, if the 530 has an RTTY/FSK mode on the mode switch, what I have just said is untrue. If the 530 has an RTTY/FSK mode, you will find that a 500 hz is plenty of filtering. 250 hz will be much too narrow for anything but the strongest stations (I know, I fell into that trap years ago - there is a technical explanation, but I don't want to get into that now). If 500 Hz is not available, 400 HZ should be OK for you.

Failing that, you might want to consider a DSP filter. I haven't had any experience with them, but I understand from reading other comments they seem to be effective.

I hope to meet up with you someday and we can have a chat on RTTY!
Welcome to the mode.

|> The problem that I am faced with is the long latency between asserting the Push to
|> talk on the radio and the radio becoming ready to send data (~600 ms).

Well, the immediate answer to this problem is to make fewer but longer transmissions. Make your frames fairly small to improve the percentage that make it through without errors, and send several frames per transmission.

Some time ago I showed that AX.25, over a fairly wide range of conditions, worked best when you send only one frame per transmission. But that assumed a much shorter turnaround delay, and more importantly it also assumed go-back-N retransmission (which is what AX.25 does). The inefficiency of having to retransmit frames that were correctly received the first time just because a prior frame was trashed is mainly what makes it a bad idea to send more than one frame per transmission in AX.25.

If you use a selective retransmission mechanism where the receiver individually acknowledges each frame of a transmission so the sender can resend those that were lost, then things could be much more efficient.

You might also consider adding forward error correction (FEC) to reduce the bit error rate, thus allowing longer frames. Depending on the channel conditions, the overhead of FEC might be less than the extra header overhead incurred by making your frames small enough to pass with high probability.

Phil

The problem is most likely due to a harmonic of the oscillator in the TNC's
microprocessor. The eprom will have no effect on this. I am not familiar
with the pk-88, but with TNC-2s and clones thereof, there is a capacitor in
the oscillator circuit which can be tweaked slightly to move it to a frequency
where there is no packet activity. It won't be enough to mess up the timing
of the TNC.

: Thanks

It depends on the filter BW. 200 Hz is too narrow, you will only get
mark or space. 500 will work fine (I use one all the time).
Bear in mind, that this is only for narrow shift (170)
Also, you could build an audio filter. Years ago, when TTY went
"clunk-clunk-clunk, we used to do this with torroids and caps. i suppose
there is a more high-tech way these days.

The filter in the rig is probably the best, the audio filter won't help
if the desense is in the rig.

I never thought that I would have a need to check in to this
newsgroup. Well, not yet anyway. Being fairly new to amateur radio
I have been examining the different avenues that the hobby has
to offer, but I figured I'd hold off on the packet thing for a while,
despite my (first) love of computers and the obvious tie-in that lies
in packet between these two hobbies.

And here I am. Why? I have noticed -- on a few things that I have
been amassing -- that individuals will say they are accessible by
such-and-such an address on packet. Now correct me if I'm wrong,
but doesn't packet interface to the Internet to a certain extent?
If this were so, then it would suggest the possibility that these
addresses might be converted to an address that is accessible
through Internet e-mail, just as Compuserve and other networks/
services are. So I ask all the great packet enthusiasts, is this
possible? And if so, how is the address converted?

Thanks,

There are three of us in this local area that want to go to a higher speed packet connection than we have now. Two of us already have 9600bps, so we do want to go faster.

We've been looking at the GRAPES modems. Since the output is on 10MHz, we need a transverter. We've got the catalog from Down East Microwave, and the 432 MHz Deluxe (15W output) looks like it will do the job. (Any of the others require at least two transverters and separate transmit and receive amplifiers.)

We'd like to know is what people who actually have GRAPES modems have. Since the distance between us is 6.5 to 10 miles, I'd particularly like experiences from people who actually use GRAPES over this distance.

Thanks,

Daniel, the major difference is the 1270C supports bank switching to the RAM chip at U25 for the enhanced mailbox. The 1270B lacks the bank switching it needs to get at the extra RAM. The unmodified 1270B it will not run 1270C firmware.

You can upgrade to the 1270C with the MFJ-46 daughterboard. It plugs into the CPU socket to enable access to the large mailbox RAM, and comes with the latest 1270C firmware.

The latest TAPR TNC-2 release is 1.1.8.

Would it be hiding the user data, or hiding any data, since it's all being transmitted? A password isn't encrypted or obscuring the meaning; if my password is "jwdjfc32," then that's the literal meaning of what I transmitted. Similarly under S/key the password means what it means, nothing, except a secret bit of shared information. Except that it's only good one time. :-)

However, authenticating packets based on a shared secret is somewhat different. There you have a hash (probably MD5) representing the data being encrypted. If you use something like DES or IDEA to encrypt this, then you are obscuring that content, because it does have a meaning other than itself, and it can't decrypted by anyone other than the parties holding the key to that session. Of course, anyone can generate their own copy of the hash, thus replicating what has been encrypted, but the content is still obscured.

> I think this is true even if the authentication cannot be verified by
> a third party who does not know the shared secret key. This is
> admittedly a disadvantage of using a keyed one-way hash function in
> the way I've described. But I think it's more than offset by the
> considerably improved performance as compared with RSA signing each
> and every packet (which could be verified by anyone with the
> corresponding public key).

But under a public key system, everyone who wants it can have your key, and thus it can be argued that you aren't obscuring the content, since anyone who wants to can decode it and get the hash. The penalty, as you say, is performance. Symetric encryption is around a 1000x faster than public key encryption. But given that most traffic today happens at 1200 or 9600 baud, I would think that most machines should be able to keep up at those speeds. The swIPe paper details workstation performance, and as I recall they got fairly good response time out of it. Most people don't have workstations doing packet, but most people also aren't running packet anywhere near Ethernet or T1 speeds.

We make extensive use of the GRAPES modem for our backbone in North Georgia. We use a less powerful transverter to go <60> miles, so I would think that the equivalent of two Dixie cups and some string would do your job. <grin> We are about to try the Down East Micro unit for the first time ourselves, but we expect acceptable performance from them.

>Set carrier timeout to never, and strap DTR high on the connector.

Or look up dialtone detection in the modem manual to avoid
the NO DIALTONE message. It can be turned off. 'course you
said you were using a SmartModem(tm) and my Hayes SmartModem
couldn't detect dialtone or busy anyway. Might not be a problem.

Another possibility we haven't considered is that the initial
hardwired RS232 link between the computer and the TNC might have
used the modem control lines to control the TNC, and the same
signals might not make sense to a modem. There's a chance, for
instance, that when the computer tried to tell the TNC to unkey
the transmitter, the modem might disconnect itself from the
"phone" line.

Good luck.

4001. CD Recording of Mod Types

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-05 22:40:58 UTC
From: khansen@ix.netcom.com
Message-ID: <39h1lq$rlj@ixnews1.ix.netcom.com>

Advertised in the "First October Issue 1994" of Amateur Radio Trader
is a 2-CD (audio) set of modulation types. The copy claims 71
emmissions with a running time of 2.5 hours. The price is $75 which
includes worldwide registered airmail (the seller is in Germany).

Have you heard of this item (or, better yet, used it)?

Hi,

Thanks for the info on the MFJ-1270-C. Can you tell me how much does
the MFJ-46 cost? Does the 1270C run the 1.1.8 TAPR firmware? I suppose there is
no easy way to upgrade it ourselves?

Secondly, does the 1270B support a mailbox? If so how? Thanks.

73 de 9V1ZV,
Daniel

p.s. I've been using a 1270B for a little while with an IC-22A. I have
received some reports of loss of audio (not carrier) when trasmitting
in high power mode. Is there any chance of this being RF induced? The
funny thing is that this seems okay on other channels.

>remapping function (like NOS rewrite) of mail.
>
>Anyone have any thoughts?

How are you connecting the JNOS and FBB Box? If you've got them
NULLMODEM cable attached, you can use the IFCONFIG LINKADDRESS command on
the JNOS box to set the JNOS-FBB port name to something other than the
normal callsign. The FBB Box can use the ALIAS and since it's not going to
go over a RF link it should be legal. Now.. if you use the same callsign
on the R: line, the FBB Box might have problems with that too. The NOS
box shouldn't care if the R:lines are the same. Also... you could put the
radio/radios on the JNOS Box and let users digipeat over the FBB-JNOS
Serial link to get to the FBB Box.

This is the Klingenfuss CD Recording of Modulation Types. I bought it soon after buying the Universal Radio M1200 digital radio decoder card. It contains copy of most digital transmission types. Mainly a wide variety of diplomatic and military types. I used it to familiarize myself with the sounds of digital types and also to verify the operation of my M1200 decoder card. The CD set does not include examples of G-TOR or Clover and would benefit from a few more examples of various MCVFT and WDM types. Still, I found it useful in developing a basic recognition of digital types.

Basically, if you have an average ear, you will only come to recognize ten or so basic types. The ARQ types have their chirp-chirp, and you may learn to distinquish SITOR-A and a couple more. And the fundamental ITA RTTY will become familiar, but the various speeds will still be hard to disting-uish. The FEC types will be harder to discern. They usually have a rhythym or grittyness different from ITA Baudot. On a few occasions, I have played the CD while listening to an unknown on the receiver. This has helped me to sort out and decode a couple of signals.

Using the CD to verify the operation of your decoder card is equally valuable. When you first get your decoder, the frustration of failing to decode much can easily discourage you. With the CD set you can learn to sort out the speeds and frequency shifts, and more importantly, learn the tricky art of manually syncing to FEC signals.

Clearly, I think the CD set is worth owning. Klinginfuss publishes a large library of books related to Utility Radio. I have bought most of and consider them to be a valuable reference library.

Hope this helps... Bye... Ted..

Call up MFJ and tell them you want info on the radio. I called them last week to get some info on the radio. They're not ready to ship yet. The radio requires some crystals with very strict tolerances and they're waiting to see what freq. people will want to run 9600b on. I suggested 145.53, 145.67 and 145.69. I asked them to send me info on what type of crystal was needed but I haven't received that info yet.

Source record: 46597

I recently installed Pakratt for Windows on my system and ran into a problem.
The program will run but will not control the PK232MBX. I tried all configuations
with no luck. To test the system I reinstalled Pakratt II for DOS. No problems!
Fully operational. To test operation from Windows I ran the DOS Pakratt in both
full screen and windowed modes. Again, no problems. Full operation.
Then I found something strange. If I run Pakratt II and quit the program and then
run Pakratt for Windows, it starts working fine! Has anybody run into this problem?
The only thing I suspect may be causing this is the age of the ROM software in
my PK232MBX (19 July 1990). It hasn't been upgraded for PACTOR but the unit
should still initialize shouldn't it?

Help! ~:)>

Before I lose patience, hair, sleep, etc., I figured someone else has already been though all this before so I'd just ask...

I want to connect a KPC-3 TNC to the DATA connector on the rear panel of my Kenwood TM-255A. This connector is a 6 pin mini-DIN (looks like the same as an S-video connector on my camcorder). The Kenwood manual shows the pnouts, but no PTT pin is shown. Maybe the data input automatically keys the rig when a signal is present???

Ant help would be appreciated. Thanks in advance.

I assume you mean 10m (28 Mhz)? That's where mine are.

I have several of these units, although they've been on the shelf since I moved from New Jersey to California over 3 years ago. Inertia and lack of time...

Anyway, in New Jersey I ran them heavily on 220.55 Mhz until we lost that part of the band. I used Microwave Modules transverters, which were about the only units available at the time. They worked reasonably well once you tune them up -- assuming no QRM. The receiver is an FM discriminator, and because of its wide bandwidth (100 Khz vs 20 Khz for ordinary NBFM) you will need proportionately more (7dB) power and/or antenna gain over that required for ordinary NBFM over the same path.

I recommend testing the path with a pair of HTs. If you can make it reasonably well with one watt, then you should have at least 5 watts on your GRAPES modem, and so forth.

These units are somewhat QRM sensitive. Part of the problem is their "stealthy" nature. A GRAPES modem cannot be heard at all on a NBFM receiver (though it may move an S-meter) because it looks like broadband noise and will not open a conventional noise squelch. So when everything suddenly stops you may find that some FM simplex users have camped out on your channel.

Around here (San Diego) the GRAPES users on 70cm are plagued by Navy radar. I've had a project going for some time to add forward error correction that should deal with this problem. It may even lessen transmitter power requirements. Some day...

GRAPES modems *can* be heard as bursts of noise on an AM or SSB receiver, or on a wideband FM receiver (e.g., Icom R-7000), and these are useful monitors when setting up your links.

I strongly recommend a transverter with a built-in PIN diode switch. Packets at 56kb/s can be pretty short, and you don't want a slow T/R relay stretching things out. This can be a problem if you need a lot of transmit power (to get you that extra 7dB). It's better to spend the money on antenna gain and try to stay within the capability of your transverter rather than add an external amplifier, most of which use T/R relays. And this will help keep RF out of your monitor, stereo, TV, etc.

Phil

>narrow?

RTTY signals are digital, i.e. not only the bandwith of the
filter is important, but the phase/delay too. Usualy a filter
with a bandwidth between 350 and 500 Hz, not having a sharp
shape, will be a possible choice for the amateur 170 Hz shift
RTTY operation.

I haven't heard of or used the product you described, but the QRZ! ham disks contain several .WAV files of RTTY and PACKET modulation types. The QRZ! disks are quite a bit cheaper than $75, available here in the U.S., and have a callbook and lots of ham shareware to boot.

4021. Help with radio modems

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-07 15:46:06 UTC
From: anurag@chandra.astro.indiana.edu
Message-ID: <CywMGu.Iuz@usenet.ucs.indiana.edu>
Source record: 46530

Hi,

We are interested in installing radio modems at our observatory in a forest nearby (line of sight distance is about 11 miles) and our department here on campus. This is so that we are in constant contact with the vax at the observatory. (The observatory is configured to run automatically, unattended.) We do this currently over a noisy phone line which won't let us work any faster than 2400 baud.

Our main problem is that we know next to nothing about radio modems. A company called DataComm sent us quotes for two new S-band spread spetrum modems (57Kbaud) with antenna for about $7500. Because I have heard that this range of freq. is particularly suseptible to interference by rain etc., we want to be absolutely sure that this thing will work (unfortunately the company charges too much money to do an actual field test). Our main concern is trees (we obtained a map of the area which shows that the line of sight WILL have trees in it). We cannot erect a tall antenna in the forest because of lightening danger/problems with geting permits etc.

Given these facts, can anyone suggest what our best best is as far as radio modems are concerned? Are the prices quoted above reasonable? Any help/suggestions will be appreciated.

: The problem is most likely due to a harmonic of the oscillator in the TNC's
: microprocessor. The eprom will have no effect on this. I am not familiar
: with the pk-88, but with TNC-2s and clones thereof, there is a capacitor in
: the oscillator circuit which can be tweaked slightly to move it to a frequency
: where there is no packet activity. It won't be enough to mess up the timing
: of the TNC.

There is no oscillator adjustment in the PK-88, but one can be added.
I ordered a new, more accurate crystal and added a padder to get the
real-time clock to stay closer to the real time on my PK-88. Could
even be that by putting a crystal in that is closer to design specs
would move his birdie to where it wouldn't matter. The oscillator
frequency on mine was quite far off. (Off by the same percent that
the real-time clock percent error was. Amazing).

The code is available on ftp.ucsd.edu and TAPR sells programmed KISS-only eproms. I don't think the KISS eprom has the reset problem, but haven't verified it. The reset problem is known, but nobody has found a fix for it yet (any volunteers?)

RTTY can easily be received through a 500Hz CW filter (assuming
your rig has an FSK setting to feed the "right" 500Hz through
the filter). I frequently run with a 250Hz filter in contests,
and most signals make it through the narrower filter. Some
RTTY boxes, notably the PK-232, use 200Hz shift instead of
170Hz. These generally decode OK, but not with the 250Hz filters.
Most 170Hz shift signals DO decode OK through the 250Hz filter on
my rig.

For RTTY, I run a Yaesu FT-990 with the Yaesu 500Hz and 250Hz filters.
At the moment I run a KamPlus for RTTY encode and decode. I used to
use a PK-232 for contests, but it is more problematic. I plan to
run a contest soon with a HAL-st8000 modem to see if using a really
super modem makes a big difference (I have a chance to borrow the
HAL item).

The hash is not encrypted. The hash is computed over the concatenation of the shared secret, which is randomly generated and carries no user information, with the plaintext, which is still being transmited in the clear. So there is no user information in the hash function output, either.

True, somebody who wanted to could hide encrypted information in the hash and claim that it's a "standard" hash, but this would not be how the protocol would normally operate. I mean, how do you know that the squelch tail you hear after every transmission on many repeaters really isn't an encrypted burst of data that you don't know how to decrypt? :-)

I'm closely involved in the IP security work in IETF. All of the current proposals for IP level security use symmetric encryption and keyed fast hash functions like MD5. Public key per packet is simply unacceptable because of per-packet overhead. I wouldn't want to come up with a special scheme just for amateur packet radio that would also serve to restrict us to slow speeds even when (if?) modems finally get faster.

4028. Use of the word "hacker" in Amateur Radio Newsline

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-07 19:46:50 UTC
From: bruce@pixar.com
Message-ID: <1994Nov7.194650.5740@pixar.com>
Source record: 46610

I was disappointed to see that the latest Amateur Radio Newsline used the word "hacker" in a sense that meant "criminal". See newsline #895, article "COMPUTER HACKER INDICTED". Here's a copy of the e-mail I sent the publisher.

Bruce Perens AB6YM

> From bruce Mon Nov 7 11:37:21 1994
To: 3241437@mcimail.com
Subject: Use of the word "hacker" in newsline

Bill,

Would it be possible for you to put a note in the Newsline writing style guide? I'd appreciate if you would use the words "computer criminal" instead of "hacker". There is more than one meaning for "hacker", and many non-criminal programmers find it offensive when "hacker" is used to mean "criminal".

Many Thanks

Bruce Perens AB6YM

Tyler,
Here follows the standard GRAPES beginning info packet. I maintain
GRAPES.ZIP on my BBS, and regularly update it. After you read it, let me
know if you still have any unanswered questions.

-------------------------cut here-------------------------------------

Heatherington WA4DSY 56KB RF Modem

GRAPES (a Non-Profit Volunteer Organization of Georgia Amateur Radio
Operators) is selling full kits of the WA4DSY 56KB RF Modem for $250.
The proceeds from the kits support our packet network building activities.

You will need a transverter with a 28 MHz I.F. for the band of your
choice, a case, connectors, power supply and frequency determining
crystals. The printed circuit boards, documentation, State EPROM,
support diskette and all other parts are supplied.

The transverter chosen should switch as quickly as possible in the
5-15 msec range to be effective. We use the Microwave Modules MMt 432-28S
units; however, these are getting difficult to find except as used ones at
hamfests. The last few we purchased new were also pretty expensive ($389).
We believe that their 220 MHz units were quite a bit cheaper, but we've never
bought any new. On the hamfest market, we have been paying $125 to $185
for used, normally working units.

Maple Leaf Communications (Bob Morton, VE3BFM) is shipping a 220 transverter
which has good charactertistics and an even better price tag ($279). We
have two of these units and they seem to work fine. Contact Bob at
705-435-0689 or RR #1, Everett, ONTARIO, Canada, L0M 1J0.

The transverter must be linear as the modem has amplitude variations as part
of the converyed modulation, which must be reproduced by the transverter.

Usually any transverter capable of SSB operation is suitable if it switches quickly enough.

We also sell a printed circuit board set that includes the State EPROM, documentation and support diskette for $110. Documentation sets are available separately for $20 and we have a VHS (beta by special request) Video tape featuring Dale Heatherington explaining the Beta modem design for $20.

Doumentation sets are creditable towards the full parts kits or board sets and the board sets are also creditable towards the full parts kits.

We pay U.S. shipping, however, we do require that the approximate difference between domestic ground delivery and premium shipping be sent in advance. Overseas second day air can cost up to $60 per kit! The kits weigh about 2.5 pounds each, and we can put 3 to 4 kits in a single box to save on shipping.

Please send orders (a letter is fine) and your check payable in U.S funds to:
GRAPES, Inc.
PO Box 636
Griffin, GA 30224-0636

We're sorry but we cannot accept Purchase Orders nor Credit Cards. Please allow four to six weeks for delivery.

THANKS!! Bob KA4BYP, email: ka4byp@netcom.com

>Given these facts, can anyone suggest what our best best is as far as
>radio modems are concerned? Are the prices quoted above reasonable?

Alas, the prices are on the low end of what good microwave link
equipment costs.

>Any help/suggestions will be appreciated.

Assuming you need at least 9600 baud duplex capability, there are
several options. Grainger Associates makes a series of duplex data
radios in the 928-952 MHz range. And you can use ordinary UHF radios
on a clear pair as well. The problem is getting licensed channels
in both cases. That's why you're seeing most emphasis on S band
and higher systems. Getting a channel assignment is much easier
at microwave since frequency reuse can be based on rather close
geographic separation. And, of course, much higher data rates
can be passed over a microwave channel.

The downside of microwave is that to get the kind of reliable signal
you need requires a clear line of sight path. If you can't clear
the trees, and the first Fresnel zone, then you're going to have
fading on the path. You need to do some testing. If you can't
find a manufacturer willing to let you test, get an experimental
license from the FCC (simple) and use a low power simple carrier

generator and receiver to watch fade margins over a course of
a few weeks. This will give you an idea of how well that frequency
will work over your path. (You really need to test over a full
year, however, since seasonal changes can have marked effects.)

Frankly, I think your best bet is to have the phone company clean
up their act and give you a good line.

Gary

: Lachlan Audas

In thinking how that might work with any version, the nosenv.bat file substitutes drive names so you could set one up to substitute the files directory on your CDROM to one that is accessible within NOS. I haven't tried it but I think I will not that I thought of this. The only other thing that accesses a CDROM is the callserver, in a few versions of NOS. I am looking for a version of JNOS that has LZW compression and a callserver. If you hear of that, please let me know HI. I'll let you know how I make out with the above test.

Just ran across an interesting pair of articles... "A New Pulsed Bi-Phase Digital Communications System" by K6HH (73 Amateur Radio, June-July 1988). Does anybody know anything about this proposal?

A quick synopsis: BPSK is performed on an RF signal, but with TINY (0.02 radian = 1.2 degrees), nearly instantaneous phase shifts, at twice the data rate. These shift pulses are decoded as positive and negative spikes coming from a PLL, with every other spike being a timing pulse (and the others data). Supposedly at such small phase shifts, the output looks like async AM. (Seems to make sense when you think of the Bessel series...) He provides a circuit that performs all of the above in 4000 series CMOS, then isolates and amplifies the single upper sideband which is transmitted. A basically complete receiver schematic is also provided, performing synchronous demod using the aforementioned sync pulses.

Ok, this seems physically feasible... but his performance claims for the circuit, namely 19.2kbit/s in < 3kHz bandwidth, seem fishy at best. The attempt at a theoretical explanation fails outright, and the experimental data is IMHO inconclusive at best. Thus my questions are: Does any of this make sense? Was it immediately debunked after its publication or just ignored? Are there any "obvious" signs that such a narrow bandwidth is flat out impossible? (Everybody I've mentioned it to immediately thinks it's impossible, after which they sit around scratching their head for a while...)

I'm tempted to try to reconstruct the given circuit, but would like to know ahead of time if it's a wild goose chase after all.

|>It's not that difficult a concept, Hank. Internet conversations which are
|>being run over amateur radio are true "broadcasting", exactly as defined by
|>the FCC. Those transmissions are not considered legal by the FCC field
|>officer who generated the opinion quoted in the original (long time back)
|>posting.

Now I've heard everything. First, what does the Internet have to do with
this? Second, if you are talking about running something like IRC or
something similar and gatewaying it through packet, how does that constitute
"broadcasting"? The stations at both ends of the amateur communication
link are amateur stations. They are allowed to transmit third party
traffic. As long as the content doesn't violate the restrictions given
in Part 97, what's the big deal? Read this definition of broadcasting
again.

(10) Broadcasting. Transmissions intended for
reception by the general public, either direct or relayed.

Where is the public receiving this transmission? They received some
bits out of a wire they are connected to. That is no different that
relaying a health and welfare message via telephone. That messages
final destination was "the public", but "the public" didn't receive
the transmission. They received the information that was contained in
the transmission by some other means.

|>The mere fact that an amateur station requested the transmission does not
|>automatically make it legal. Nor does it automatically convert a message
|>posted to "WORLD" on the net into a valid amateur to amateur communication.
|> Remember the recent FCC blurb that holds the operator of the "first
|>posting" entry point station responsible for message content and
|>compliance.

Yes, and that blurb was a result of a message that involved a pecuniary
interest, i.e. a money making message as a result of urging you to dial
a 900 number.

|>Hank, this is NOT true when you start allowing cross-connection to the
|>general public by using either an internet gateway or even phone dial ports
|>to an amateur BBS. I believe that these are the situations that both the
|>NOCALL OO and Steve are addressing. From your comments it appears that IN
|>THIS NARROW SITUATION (and most certainly NOT the broader general case of
|>ALL amateur packet traffic) you would agree that Steve and the FCC are both
|>correct.

How the content of a message originated is completely and totally
irrelevant as long as it is valid third party communication, i.e.
in the case of foreign countries, only with a country with a third party
agreement. Please cite the regulation that limits the content of
third party traffic that makes it illegal to cross-connect to the general
public? What do you think a phone patch is????? Or have you now declared
all phone patches illegal too?

|>Obviously the first target above is debatable; the second is a case where
|>the rulemaker is being challenged, much like a small mouse antagonizing an
|>elephant. That is probably not a good thing to do unless one wants to be
|>stepped upon and find the transmission of all non-amateur originated
|>broadcast messages prohibited, which is exactly what 97.3 says.

Please stop intertwining broadcasting and third party traffic origination.
They are clearly independent issues. Third party traffic is not necessarily
broadcasting and broadcasting is not necessarily third party traffic. They
are orthogonal to one another.

|>I must side with Steve on the specific narrow case that I presented above.
|>I am afraid that many within the amateur community have greatly over-stated
|>their perceived importance in being part of the Information Superhighway,
|>while the commercial providers feel that we are only a back alley. If the
|>FCC takes away our interchange (both figurative and literal) we will have
|>neither advanced the state of the art or served the public interest.

Who gives a rat's ass about the Information Superhighway? That has
absolutely *nothing* to do the issue. Several posters have somehow tried
to twist this debate around into "packet shouldn't be competing with the
Internet". Why are you doing this?

73,
Todd

Hello ALL

I read about NEW 2400bps radio modem from MFJ and other.
What's tone standard for Amateur Packet on 2400 ?

I believe that they use some higher AFSK tone than on 1200bps.
I heard about 3658/1996 Hz. Is't true ? Or maybe there no any
standard yet...

I'am try play with TCM3105 on 2400 (it work if S/N is good) and will
set up true tone.

Tnx in advance, 73! de RX3DIN Victor

> but doesn't packet interface to the Internet to a certain extent?

Some of packet, notably the tcp/ip stuff started by Phil Karn has
SMTP so that mail is handled the same way as on the internet. Newer
versions of NOS (newer than NET for the nit pickers) have SMTP to
Packet BBS mail handling provisons. Some NOS systems are actually
connected to the internet and as such handle mail both ways. The real
PROBLEM is the name addressing conventions only *look* the same.

> If this were so, then it would suggest the possibility that these
> addresses might be converted to an address that is accessible
> through Internet e-mail, just as Compuserve and other networks/
> services are. So I ask all the great packet enthusiasts, is this
> possible? And if so, how is the address converted?

Internet e-mail is domain based. Packet e-mail is location based.

4058. Capabilities of Linux & BBS

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-08 20:40:07 UTC
From: Mitch@lexmark.com
Message-ID: <Cyyuqv.EKE@lexmark.com>
Source record: 46639

I'm currently running the AA4RE BBS software for our club BBS. I'm interested in switching the system over to Linux and running one of the NOS variants. As someone with little NOS experience, I have many questions:

1) The system running the BBS has only one serial port and can't be expanded. I run JKISS code to allow multiple TNCs to be connected to this port. Is there a JKISS driver for Linux or would I have to switch to KISS and only support a single TNC?

2) Bulletins.... The BBS today has an average to 600 avtive bulletins. Does NOS have automatic expiration and other utilities to manage an ACTIVE BBS ?

3) One of the main reasons I want to switch is to provide more capability. I'd like for a user to sign in and run games or other programs while other users are active. Is this feasable?

4) Which version of NOS is the best? (I don't want to start a flame war).

I'd appreciate any other words of wisdom you might share.....

Thanks, Gary WB9TPG

Is that so? How does it become "broadcasting"?

When your station transmits it to the general public, how does your
station DO that? On what frequency? Using which mode?

Just because an FCC field officer (or me, or you, or any other individual)
says something is so, does not make it so. The rules ARE what they
are, read them and make a real attempt to understand them.

|>

Is that so? Would you please quote where it says this in the rules.

Remember, we are NOT talking about messages with illegal content here
(that is a separate issue, easily understood from the rules).
We are talking about "broadcasting", which is NOT done by any packet
stations now in existence.

|>

|> correct.

Are they? Please quote where they said this.

What you mention above is issues of CONTENT only.

All the radio communications involved are between pairs of amateurs
who are in QSO. Whether the content is 3rd party or not, there is
no "broadcasting" nor any "general public" involved.

|>
|> Obviously the first target above is debatable; the second is a case where

|> broadcast messages prohibited, which is exactly what 97.3 says.

The FCC has said nothing on this topic. Someone who happens to work
for the FCC gave an opinion, and that is all that has happened.
The opinion was given about a totally different topic ("broadcasting")
which we are NOT discussing here, since no "broadcasting" takes place.

|>

|> while the commercial providers feel that we are only a back alley. If the
|> FCC takes away our interchange (both figurative and literal) we will have
|> neither advanced the state of the art or served the public interest.

The FCC cannot "take away our interchange" since it has nothing to do with ham radio, nor with the internet, but simply has to do with what some hams choose to submit to the ham radio network - i.e. to tell to some station they are in QSO with. Try real hard now, and you can perhaps understand this. For example, if I'm in QSO with you, and tell you "I heard on CNN that there was a major quake in the Atlanta area." it is NOT "broadcasting" the intent it NOT to distribute that information to the general public, and it is not (yet) 3rd party traffic. Whether I got the information by watching CNN, reading usenet news, perusing a LL BBS, or eavesdropping on my neighbors makes NO difference at all. What YOU do with the information is your business, and yours only.

Note that the recent change in the rules LOOSENS the requirements, not TIGHTENS them. The rule change has the following effect: if the FCC gives me a ticket for transmitting profanity from my packet station, and it the message containing the profanity did not originate at my station, but was forwarded to me during my operation as part of a network of cooperating stations, THEN I can use the defense of "not my fault", and win.
Prior to the change in rules, such a defense was not available to me.

Is this really so hard to grasp?

What are "you folks" trying to do here, anyway? Shut down the digital networks by spewing forth quasi-legal sounding scare messages?

Tell us about your agenda ...

... Hank

Hello,

I am very new to packet communications and have a question
concerning a problem I am experiencing with the kantronics
KPC-3 and a HT (yeasu FT-11)....
.
My problem is that I can get a connection to a local pbbs
and get a connections using PACTERM but....I appears that
the connection loosing interest overtime....I receive some
text, a couple lines of text, then the connection seems to
just hang there...eventually I get disconnected, I think
the receiving signal is strong, I have also adjusted the
squelch and volume to try to rememdy the situation but
no such luck......reconnection I see the same time, a valid
connection, a couple of lines of text then I hang...
any advice?
.
signed,

Textless & Torked!

That's interesting. Currently there is a place called Pegasis
Data Systems or something that is hawking a scheme called "VPSK"
that sounds similar to the above explanation. In the above case,
what is described is simply taking a baseband data transmission
scheme and upconverting it to an RF frequency. It will occupy
the same RF bandwidth as it did at baseband. It doesn't seem

like the signal would fit into 3 kHz. (certainly not with "instantaneous" phase transitions.) Of course there are schemes that will. Just feed a 19.2k modem into the mike input of an SSB transmitter, and you have 19.2K in 3 kHz. BW. But it's done with QAM, not the scheme in the 73 article. The tradeoff is that you need well upward of 20 dB. signal to noise ratio to do it. Now in Pegasis's case, they claim they only need 10.5 dB. S/N because Shannon's law no longer applies. Yeah right. And they're not even using FEC. Both cases make no sense to me. Anyone else confirm or deny this?

CAPRA (Chicago Area Packet Radio Association) is hosting an all-day digital seminar by Kantronics. The seminar will cover everything from beginning packet to advanced digital techniques/modes. This seminar was held in 1990 & 1992 to a standing room only crowd.

The seminar will be at Harper College in Palatine, IL starting at 8 AM. To get there take I-90(NW Tollway) to Roselle Rd. north. Or take Rte. 53 to Euclid Avenue West.

If you have any questions, drop me an E-mail. See you there.

: Ok, this seems physically feasible... but his performance claims for
: the circuit, namely 19.2kbit/s in < 3kHz bandwidth, seem fishy at
: best.

Not only fishy, but impossible. The bandwidth of a 19.2 kbps binary signal at baseband is 9.6 kHz assuming perfect filtering. A BPSK RF signal, no matter how small the phase shift, would require twice that, or 19.2 kHz. Even if you could figure some way to do an "SSB" BPSK signal, you'd still need 9.6 kHz.

It's theoretically possible to send 19.2 kbps in less than 3 kHz bandwidth using 128QAM, 128PSK, 16VSB, etc, but not with a 2-level modulation format like BPSK. (You can also do it with data compression, but that's cheating :=)

No, it is over the packet net becoming a Usenet with more emphasis on sewing
and cooking than amateur radio. It is a discussion about whether or not a
informational bulletin to all entitled "sewing" and comprised of non-amateur
material is a bulletin or a message. The main arguement against it being
a bulletin being the look and feel of the ax.25 connection ... it looks like
a QSO. The main arguement for it being a bulletin stemming from a number
of sources.

It is quite mature and has degenerated into a line-by-line rebuttals containing
50% name calling, 45% drivel and 5% information. It is pretty much beat to
death.

OK Lee, here's the Listproc help file from the NOS-BBS list server. Hope this
does the ticket.

ListProcessor version 6.0

July 1993

Preliminary User's Guide

Contents:
----
1) What is ListProcessor
2) How do I use the ListProcessor
2.1) Regular users
2.2) List owners
3) Archives
4) Format of requests
5) More information

1) What is ListProcessor

ListProcessor is a system that automates mailing lists and archives. Users
may add themselves to mailing lists supported by ListProcessor, post messages,
review the members of a list, etc. The system also maintains hierarchical
archives of files that users may get. Archives and mailing lists may be
private,
which means that a password is required for archive access, and that the owner
of a private mailing list decides who may suscribe and who may not. Lists may
also be moderated, in which case the owner decides which messages are made
public, and which are flushed.

2) How do I use the ListProcessor

There are two levels of users: a) regular users who subscribe to lists and

send/receive messages and get files from archives, and b) list owners who oversee the functioning of lists. There is of course a system manager that oversees the entire operation.

List owners have certain privileges: they can add and remove users from their lists, reject postings to moderated lists, manipulate addresses, etc.

All users interact with ListProcessor by email. ListProcessor understands a very
limited set of requests and expects a fixed syntax for each one of those. Users send email to listproc@hydra.carleton.ca when they wish to have a request processed. If
users want to send a message to a mailing list, they email to list-name@address instead.

2.1) Regular users

Usually, the first thing that a regular user will want to do is find out which lists are available for subscription. He should then send email to listproc@hydra.carleton.ca with a 'lists' request in the body of the message and nothing
else.

He then subscribes to a list called foo by sending another email to listproc@hydra.carleton.ca with the following request:

subscribe foo <His Name>

where <His Name> should let people know who he is.

Once subscribed, he may send messages to foo@address. He may remove himself from that list later on by issuing a:

unsubscribe foo

request to listproc@hydra.carleton.ca.

To access the archives, an 'index' request is sent to listproc@hydra.carleton.ca to find
out what archives are available and what files may be obtained from these archives. A user then may request one or more files via a 'get' request. For example:

get products/database/name/version/fixes patch

will send the file patch from that archive. In the case of binary files, what the user receives is a uuencoded file, possibly split in parts due to its size. Archives may be searched with the 'search' request which accepts an egrep(1)-style pattern,

For extensive information on all requests, listproc@hydra.carleton.ca accepts requests
like 'help [topic]' where 'topic' is a request.

2.2) List owners

List owners are users who have special privileges on the lists they are assigned to. Each mailing list has at leat one primary owner and may have infinite secondary ones. The primary owner will be the recipient of all error messages and may set more preferences by contacting the system's manager; these preferences include requests to be copied on certain user requests. For example, an owner may wish to be notified when someone subscribed to his list, or when someone signed off.

Each list is accessed by an owner via a password. All owner requests require that password. In addition, the email address of the owner is verified for such requests.

The following owner requests (which should always be sent to listproc@hydra.carleton.ca)
are recognized (refer to the man page for hidden owner requests not mentioned here):

a) reports <list> <password>

A copy of the report files on list activity are sent to the owner.

b) edit <list> <passwrod> <file>

Each list is controlled through some system files. These include the subscribers file, the welcoming message, the aliases file and the ignored file (enemies of the list). Refer to the man page for more information.

c) put <list> <password> <keyword> [args]

The aboved edited files may be put back using this request. The owner may also put new aliases and enemies to the database. Refer to the man page for more information.

d) approve <list> <password> <tag>

If a list is moderated, each message sent by a regular user is forwarded to the primary owner for review, editing and approval. Each such message is identified by a unique tag number. The owner sends back the approved message to listproc@hydra.carleton.ca preceded by the above request, and provides the proper tag
number.

e) discard <list> <password> <tag>

This is the opposite of 'approve'. A message that is not approved or discarded will remain in the queue for ever.

3) Archives

Each mailing list may have its messages automatically archived. This can be useful for newcomers who want to catch up with the discussion, or for posting and archiving FAQ's.

The system may also keep archives of patches, and other types of files. As explained before, archives may be private in which case passwords are required for access for both the 'index' and 'get' requests.

4) Format of requests

For the most part, requests span a single line. However, for whatever the reason a request may be continued on another line if it is terminated by &\n (ambersand followed by carriage return).

Requests like 'put' may take a file as argument (like the subscribers file, or the welcoming message). In these cases, the actual text follows the 'put' request and spans till the end of the message. For example, here is a session where the owner would put the welcoming message:

```
% mail listproc@hydra.carleton.ca
Subject:

put my-list my-password welcome

Welcome to the my-list list. You may sign off any time by sending the
following request to listproc@hydra.carleton.ca:

sign off my-list

Enjoy!
^D
%
```

5) More information

See server(1) for system setup and management.
See listproc(1) for list owner information on list management and their privileges.
See list(1) for information on moderated lists and how to define user aliases and unwanted users. Also how to connect to news groups.
See listproc(1) for a complete description of all user requests.

4074. Best 2m mobile for packet?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-09 18:08:19 UTC
From: kanefsky@halcyon.halcyon.com
Message-ID: <39r36j$8v@news.halcyon.com>
Source record: 46506
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.digital.misc

I'm looking for a 2m mobile radio that will work well for packet (up to 9600bps), but which won't be used exclusively for packet. Actually, I plan to use it as a base-station first while using an HT along with a portable TNC and notebook computer running TCP/IP as the mobile end of the link. Later, I'd like to get a more serious base-station and use the radio I'm about to buy as the mobile end of the link.

So far I'm looking at the Kenwood TM-255A (which is a 2m all-mode mobile with a detachable faceplate) and the Icom IC-281H (which is a 2m FM transceiver with 440 receiver). These are at opposite ends of my price range, with the Kenwood being much more expensive than the Icom. Both of them have data jacks and claim 9600bps capability out-of-the-box, but recent articles suggest that most FM-only transceivers aren't suitable for 9600bps packet.

I've heard various bad things about Kenwood in these newsgroups before, but I don't really see anything comparable from the other major brands. Does anyone have any experience with these radios, especially with respect to packet? Any other suggestions would be greatly appreciated as well.

Thanks,

--

Source record: 46510

Cylink sells a few RF modems for 902-928 MHz that fall under the spread-spectrum no-license rules. They've run units as much as 30 miles under ideal conditions (between mountain-top sites, big antennas, LOS).
They have 64 kbps, 128 kbps, and 256 kbps units. I've used the 128 kbps units for mobile VTC.
You simply plug in your antenna (units come with rubber ducks!), the power supply, and your data (EIA-530/RS-449 or V.35, as I recall), and go.

Try them at 708-377-7300 (I think that's the Chicago area office).

Check out the program 'PacketPeT Lite For Windows'. This is a shareware / demo version of a commercial Windows program that supports the KAM and KPC3, along with a variety of other packet TNCS. It is a product with many improvements under development for the future, although it has been on the market for about a year now. The shareware version can be found on AOL in the ham club, Compuserve in the HAMNET, and Genie in the Radio-Electronics section. I do not know if it is at an internet location or not.

controllers. Though on the market for a year, it is a product that
continues to evolve. I am not sure about Internet sites proper, but the
shareware version can be downloaded from CIS HAMNET, AOL the Ham club, and
from Genie Radio-Electroncis sigs.

PacketPeT has many unqiue features, and is worth trying for free. If you
have tries it in the past, check out the latest 2.03b release. We are
constantly inproving it, and there are some major new features planned for
95.

Does anybody use simple TNC BP-1?
The ADs in QST, CQ say that it cost $49.95 and can be use
for Packet.
I appreciate for any information.

Hi everyone,
I am new to packet radio and am looking at purchasing a TNC. I am
currently considering either the Kantronics KPC3, the AEA PK-12, or the
MFJ 1270C. Any comments on these ones, or any others would be appreciated.
I will be using it with a Cushcraft Ringo Ranger AR270 2M/440 roof mounted
antenna, a Realistic HTX-202 2M FM HT (w/ plans to eventually get a
dual band radio), and either a 386sx/25 or a 486DX2/66. Please send
all replys to my email address: srbarnet@nyx.cs.du.edu

|> : the circuit, namely 19.2kbit/s in < 3kHz bandwidth, seem fishy at
|> : best.

Yeah. Even if it worked, the power efficiency would be *extremely*
poor. Almost all of his transmitted energy goes into the carrier,
which carries no information. BPSK is normally an antipodal modulation
technique, which means that the two possible symbol vectors (0 and 180
degrees) are maximally distant, and for random data there is no
discrete carrier component. This give you the best possible protection
against additive noise: a 3dB improvement against an orthogonal
modulation method such as coherently demodulated FSK with sufficient
mark/space separation. Because the two symbol vectors in this
"narrowband BPSK" scheme are so close together, there is very little
protection against noise.

This guy could have benefited from reading a basic communications
theory textbook. But as absurd as it is, his scheme is still useful in
illustrating a counter-intuitive yet fundamental principle that still
isn't widely appreciated. That is, minimizing bandwidth is exactly the
wrong thing to do to when you're trying to maximize spectrum
efficiency. That's because the more "bandwidth efficient" you make
your signal, the more susceptible to noise and interference it MUST
become. Much more power is then needed to compensate for the noise
and interference, which means even worse interference to everybody
else on the band.

Minimizing *power* is what really counts, because power, not
bandwidth, is what causes interference. We should get rid of all
modulation bandwidth limits in amateur radio (as long as you stay
within the band) and replace them with a requirement for automatic
transmitter power control.

John P. Costas, K2EN and the inventor of the Costas Loop, wrote a
classic paper in the late 1950s called "Poisson, Shannon and the Radio

Amateur" in which he laid out the theoretical foundation for this approach. He was only 3 decades before his time. Only now has the technology finally become capable of implementing his vision.

His thesis was that the whole concept of frequency coordination is doomed to failure in the real world, and he held up amateur radio as an example. The only real solution is to switch to interference-resistant modulation techniques, which according to information theory implies "broadband". Spread spectrum is the purest example, but the same concepts apply to other systems that are not technically spread spectrum.

It's well worth reading.

From: csetzer@rmii.com
Message-ID: <39scs2$j2k@potogold.rmii.com>
Source record: 46525

Is there anyone who has the Kenwood TM-733A and the Kamtronics
KPC-9612? I have some problems...

1) The KPC-9612 XCD (external carrier detect) pin requires a ground to
indicate carrier, yet the TM-733A SQC (squelch control output) pin
sends +5 Volts on open squelch (carrier) and 0 Volts on closed squelch
(no carrier). So the KPC only transmits when there is data coming in...
which is backwords.

2) When the KPC is in software mode (ignors XCD and SQC) I can only
pick up the strongest stations (S8+) and then only part time.

Is there someone who is running this radio and TNC who is not
having problems, please email me at csetzer@rmii.com

Thanks,

Craig

4090. TM-733A / KPC-9612 Help!!!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-10 07:04:00 UTC
From: steve.diggs@totrbbs.atl.ga.us
Message-ID: <3153.18.uupcb@totrbbs.atl.ga.us>
Source record: 46536

-> 1) The KPC-9612 XCD (external carrier detect) pin requires a ground
-> to indicate carrier, yet the TM-733A SQC (squelch control output) pin
-> sends +5 Volts on open squelch (carrier) and 0 Volts on closed
-> squelch (no carrier). So the KPC only transmits when there is data
-> coming in... which is backwords.

Here's a suggestion: forget the external squelch for now. If you have fulldup turned off, (the default state) the TNC will not XMT while the state machine is detecting data carrier. That's all you need for the moment. We've used the TM733a multiple times here, and no one uses <or needs> the external squelch feature. Nice feature, just not one for the beginner.

-> 2) When the KPC is in software mode (ignors XCD and SQC) I can only
-> pick up the strongest stations (S8+) and then only part time.

This is a different problem. The TM733a puts out a very high level on receive audio (RXA) of about 600mv. This will swamp the typical G3RUH compatible modem receive section. Set up a voltage divider and reduce that to about 50mv. I think you will find your receive sensitivity go way up.

From bbssig@tapr.org Fri Oct 28 18:21:48 1994
From: dwolf@tcet.unt.edu (Dave Wolf)
Subject: [BBSSIG:161] Position Paper on Recent Bulletin Flap

Position Paper on Packet Bulletins
Tucson Amateur Packet Radio
approved and released by the Board of Directors, October 28, 1994

There has been a recent flurry of activity on the packet
networks as documented here on BBS SIG over some packet
bulletins issued by Frederick Sober, AB6GQ, an Official
Observer Coordinator in the Sacramento Valley section of the
ARRL. The concern expressed by AB6GQ is that packet bulletins
whose contents do not relate to amateur radio are in violation
of Part 97. I have reviewed AB6GQ's bulletin, two letters from
(FCC Personal Radio Branch Chief) Johnny Johnston, and
discussed the matter personally with AB6GQ by phone on Sunday,
October 23rd.

Here is a brief history of events, primarily reported by
Frederick: in 1993 as an OO, AB6GQ was contacted by several
local packet BBS sysops who were concerned over the content of
bulletins addressed, for example, to ALL @ ALLUS, ALL @ WW, and
so forth. The content of many of these bulletins did not
include ham radio-related subject material, and they wondered
if this was a violation of Part 97. According to Frederick, he
contacted his section manager, who advised for him to get in
touch with League headquarters. He was advised by a League
Regulatory Information staffer to contact the FCC directly.
Someone at the Hayward field office referred him to
Washington. An exchange of correspondence with Johnny Johnston
ensued (texts of Mr. Johnston's letters have been transcribed
to the SIG from copies obtained by Greg Jones). AB6GQ has been
advised that the League is going to 'undertake an educational
effort' about which something will appear in QST after the
first of the year. Frederick advises he is going to wait for
further word through the League chain of command for his next,
if any, action regarding packet bulletins.

Because the spark which created this particular packet 'crisis of the day' was a statement to other amateurs from an Official Observer Coordinator, and because there was a reported exchange of correspondence with an FCC branch chief, Greg Jones, President of TAPR, received numerous phone calls asking for TAPR's position on this matter. Greg discussed this situation with several League officials and other respected advisers prior to discussing it with the TAPR BoD. Subsequently, Greg requested that I draft this position statement for TAPR.

To be succinct, most of the flame wars and great debates over permissible communications exhibit a problem with semantics, not a lack of specificity in the rules. Packet* is not some mutant communications form that is not definable by the rules. Packet is no more or less privileged than any other form of amateur communications. (*packet is used here, but this argument extends to all legal forms of amateur digital communications which are used for the forwarding of bulletins)

Did you know that Part 97 comes complete with its own dictionary? 97.3 includes a list of definitions for the terms used in the document. Two definitions that are either overlooked or misinterpreted by many are 'broadcasting' and 'informational bulletin.' 'Broadcasting' specifically means transmissions intended for reception by the general public (see 97.3 (10)). The term 'informational bulletin,' defined by Part 97.3 (23) has no relation to what we refer to as a packet 'bulletin.' Part 97 defines an 'informational bulletin' as a one-way transmission to hams of a message of subject matter composed solely of interest to the amateur service. A good example of an informational bulletin is a transmission of ARRL bulletins from W1AW. To conclude that all of this means that a packet bulletin must be confined to amateur-only subject material is using terribly convoluted logic. Packet makes a poor choice for an informational bulletin anyway. Except for unproto, their is no one-way packet mode. It takes two to tango. A packet bulletin is entered on a BBS from the originating station in a two-way communication. From then on out, that packet bulletin is a third-party message. If it gets forwarded from one BBS to another, it is a third-party message being forwarded during a two-way communication.

97.113 lists prohibited communications and their exceptions. There is no specific prohibition against content with potentially controversial or frivolous subject material. This particular 'crisis of the day' arose , as so many others have arisen, because of message content. There is general agreement that many of the bulletins traversing the network aren't worth the electricity used to forward them. Studies in several metropolitan areas show that over 70% of the bulletins NEVER get read. They just get listed. This means users are being very selective about what they read. They DO have a choice.

So do sysops. The process of reducing the amount of what many of us consider to be 'noise' on our boards begins with each of us exercising leadership at home. If someone posts a SALE @ ALLUS bulletin on your board trying to unload a camping tent, tell them nicely that this isn't appropriate. If you have a religious fanatic or political alarmist climbing on the electronic soapbox (and that soapbox has your callsign stenciled on the side), it's time for a heart-to-heart. Easy? Not always. Whoever said that running a BBS was gonna be easy? What are you doing to get the word out that packet radio, while sometimes loose, is not a free-for-all. Ham radio, ALL facets of ham radio, because of the wide constituency we have, is a place where people have to be responsible. It's much harder to educate than legislate, but which do you think has the more effective results?

The lessons learned: If you've got a question about the rules, use the resources available to you WITHIN the amateur community INSTEAD of making an end run straight to the Commission. Document who you speak with and what was said. Get whatever you can in writing. Think of the potential impact on ALL of amateur radio when a small chunk of the overall activity (such as packet in relation to everything else) is the focus of possible new regulation or enforcement. This is not to suggest that the rules be violated or that anyone stick their head in the sand about abuses that may exist. It is better to try to take care of business ourselves, as we are encouraged to do in the rules, than to invite possible over-regulation by the FCC. This issue may be put to rest forever preferably by the League setting the record straight that packet bulletins are not one-way transmissions or broadcasting, and that 97.113 is explicit about permissible content of amateur communications.

Incidentally, I found AB6GQ to be very open about this incident and very surprised to find himself at the eye of a hurricane. He admits to a degree of initial naiveti in his effort to be a responsible OO (and now an OOC). Frederick wants everyone to know that he and his team of OO's don't have a hidden agenda and most importantly, they aren't vigilantes. They wanted some answers to questions about packet bulletins. Some missteps and miscommunications (by numerous people) led to something being given far more relevance than it deserved.

4093. Pen Pal Wanted for Packet vs. email Test

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-10 10:34:13 UTC
From: tgold@microvst.demon.co.uk
Message-ID: <784463653snz@microvst.demon.co.uk>
Source record: 46540

Hi,

I recently registered at a packet/internet gateway and tried it out. The messages which I dispatched via email arrived at the packet stations, but their appearance has been altered. All blank lines had been filtered out somewhere along the way.

The gateway operator says he had not seen that before and guessed that is was something that AMSAT was doing. Anyone know whether this is a feature, a bug or even something happening somewhere else in the path?

Anyway, may I send the test message to others OUTSIDE the UK and receive back a report on how the test message arrives.

This is the original test message I sent out:

Test starts here:

This is Tony's keyboard:

```
` ! @ # $ % ^ & * ( ) _ +
~ 1 2 3 4 5 6 7 8 9 0 - =

q w e r t y u i o p [ ]
Q W E R T Y U I O P { }

a s d f g h j k l ; ' \
A S D F G H J K L : " |

\ z x c v b n m , . /
| Z X C V B N M < > ?
```

That's all there were.

--

Tony - G3SKR / AA2PM / tgold@microvst.demon.co.uk
End of my packet test.

Now here is the body of what was received. The received packet message was indeed far longer as the routing information appended at the head was far longer than the message itself!

Packet message as was receive by 2 amateurs in the UK:

This is Tony's keyboard:
` ! @ # $ % ^ & * ( ) _ +
~ 1 2 3 4 5 6 7 8 9 0 - =
q w e r t y u i o p [ ]
Q W E R T Y U I O P { }
a s d f g h j k l ; ' \
A S D F G H J K L : " |
\ z x c v b n m , . /
| Z X C V B N M < > ?
That's all there were.
Tony
G3SKR & AA2PM

```
+-----------------------------------------------------------------+
| *** Message via SATGATE through Amateur Packet satellites. *** |
| AMSAT needs your help to keep the satellite service operating. |
| Check your BBS files for info on AMSAT or REQFIL the file |
| C:\GB7LAN\AMSAT.DOC from GB7LAN. |
+-----------------------------------------------------------------+
```

If any-one will help, please post or email your packet address. Then when you get the packet message, simply email me whether the message was intact or compressed of blank lines. If anything else odd happened, forwarding it back via email would save trying to describe the results.

Thanks for any help.

|> negative spikes coming from a PLL, with every other spike being a
|> timing pulse (and the others data).

Here's a quick simplified performance analysis against additive white gaussian noise (AWGN). I just worked this out myself, so I could have made a math error. Somebody please correct me if I'm wrong on any of this stuff.

I'll model this thing as ordinary coherently demodulated PSK with a 1.2 degree shift, ignoring the "pulse" stuff. That can only make things worse in the actual system.

The probability of a bit error in a coherent PAM (combined phase/amplitude) modulation scheme is

Pe = Q(d/(2s))
where
Q() is the gaussian tail function: Q(x) = .5*erfc(x/sqrt(2))
d is the minimum Euclidean distance between constellation points
s is the standard deviation of the noise

The factor of 2 comes from setting the decision thresholds halfway between each pair of constellation points. The receiver compares the received vector to the nominal points and picks the closest one; if the noise has moved the received vector more than halfway to another point, an error results.

For conventional antipodal BPSK (a phase shift of 180 degrees or pi radians), taking the signal amplitude as unity,

d = 1 - (-1) = 2
s = 1/sqrt(Eb/N0)

where
Eb = energy per bit in joules
N0 = noise spectral density in watts/hertz (aka joules)

Eb/N0 is a dimensionless ratio, sometimes called the "per-bit signal to noise ratio". It's often expressed in dB, but here it's just an energy ratio.

so plugging and simplifying,

Pe = Q(sqrt(Eb/N0))

which you can find in all the textbooks (e.g., Lee & Messerschmitt pp 190, 299)

Now let's look at PSK with a 1.2 degree (0.02 radian) shift. Again assuming unity signal amplitude, the distance between the two constellation points is now only .02, vs 2 for BPSK. To find the Eb/N0 that achieves the same probability of error as BPSK, we can remove the Q function from both sides and set up the equality

sqrt(EbBPSK/N0) = .02 / 2 * sqrt(EbK6HH/N0)

with
EbBPSK/N0 = Eb/N0 required for the desired bit error with BPSK
EbK6HH/N0 = Eb/N0 requird for the same BER with K6HH's scheme.

Squaring both sides and solving for the ratio of the two Eb/N0s:

EbBPSK/N0 = (.01)^2 * EbK6HH/N0
EbBPSK/N0 / EbK6HH/N0 = (.01)^2 = .0001

Since Eb/N0 is an energy ratio, we can do everything in dB:

EbBPSK/N0 (in dB) - EbK6HH/N0 (in dB) = 10log10(.0001)
= -40 dB

I.e., to achieve the same probability of error as conventional BPSK, K6HH's "narrowband" PSK scheme requires an Eb/N0 that is 40 dB higher. This might not matter in a hardwired prototype on the bench with no additive noise, but it would definitely not be considered practical in any on-air system I know of.

|> its publication or just ignored? Are there any "obvious" signs that
|> such a narrow bandwidth is flat out impossible?

Shannon says you can pack as many bits/sec as you want through a narrow band channel IFF you have a high enough signal-to-noise ratio. All you need is a higher order constellation, i.e., one that sends more than one bit per symbol. The problem is that the required S/N increases exponentially, i.e., it quickly becomes astronomical.

The right way to build a bandwidth-limited modem that comes close to the Shannon limit is with trellis coding. That's the basis of V.32, V.32bis and V.34. Trellis code modulation deals with the problem in a two-dimensional high order constellation that the constellation points are not equally distant from each other, i.e., not all error transitions are equally probable. It's far more likely for a symbol to be confused with its nearest neighbor than it is to be confused with a symbol on the opposite side of the constellation.

In trellis coded phone modems you add FEC to some (but not all) of the bits in each symbol, and you assign these bits to the symbols such that the FEC corrects the most common errors (confusion with nearest neighbors). This has the effect of leveling out the effective distances between the constellation points, permitting the basic scheme to more closely approach -- but not exceed -- Shannon's limit. (You can look at trellis coding as trying to pack lots of hyperspheres in multidimensional space so they're all equidistant from each other, but my brain always hurts whenever I try to visualize this.)

K6HH has to obey Shannon, even if he doesn't think so. It's widely accepted that beating the Shannon limit is roughly equivalent to building a perpetual motion machine. Somebody just mentioned to me in email that K6HH actually obtained a patent on his scheme. Guess that wasn't the first perpetual motion machine that's ever been patented...

: the experimental data is IMHO inconclusive at best. Thus my questions

Claude Shannon's famous theory showed that as you narrowed the bandwidth
for a given data rate, you needed a better carrier to noise ratio. Thus,
there isn't a theoretical limitation on how much data you can stuff
through a noiseless channel, though there obviously is for real channels.

Unfortunately, his theorem only indicates limits--it doesn't offer a clue
as to how you can achieve them.

Practically, it is tough to get 40 dB signal to noise ratio over many
of the radio channels used by amateurs. 60 dB is nearly impossible.

Does anyone know of software that will allow one to use a
Soundblaster card on a PC to send and receive packet? I'm not even
sure if this can be done, but suspect it is possible. I would
think it would be something on the order of the Baycom stuff.

4101. SP (ESKAY) Packet under Windows

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-10 18:11:03 UTC
From: dfrank@carbon.denver.colorado.edu
Message-ID: <39tnnn$107@carbon.denver.colorado.edu>
Source record: 46545

I have been running SP with 2 TNCs under Windows 3.1 for some time with no problems, using non standard comport interrupts. One TNC running WA8DED firmware is on port3 (3E8) IRQ10, and the other, in KISS mode under TFPCR, is on port4 (2E8) IRQ5.
When I changed the firmware in the TNC running in KISS mode, to WA8DED eprom, leaving the port as it was (2E8,IRQ5), and of course making the necessary changes to CONFIG.SP, the system will not come up under Windows anymore!
It gives me the error message " Cannot use IRQ2 under Windows ", and dumps me.
The program runs perfectly however, under DOS so the configuration for the TNCs appears to be OK. The version of SP I'm running is 6.11.

Are there any experienced SP users out there in netland that might have a clue as to what's going on? Why am I being told not to use IRQ2, when I'm not using it?, and why did it work just fine under windows using the TFPCR Kiss driver with the exact same address and IRQ that it doesn't seem to like when using the preferred WA8DED firmare? Has anyone else experienced this problem?

Any comments would be appreciated. Thanks in advance,

Don, W9SL, Denver, Colorado.

Dear Textless,

It may be your own station parameters are not compatible with the ones in use on your LAN. If you have your timing parameters too passive, even a little traffic on frequency will delay your transmissions until you time out. If you run them too agressively, your station doesn't wait for responses and will also time out. Could be a matter of the amount of traffic on your LAN freq and the settings of your parms. With the KPC-3, you can set the carrier detect to the software mode, which will allow you to run your squelch wide open, and result in weaker signals being copied. Could be a lot of things. Good luck with it.

> Let me know of a good program and where to ftp it and I'll be happy :)

I use VersaTerm-PRO for packet, telephone modem, telnet, and ftp. But it is commercial software, and only runs on a Macintosh.

On Unix hosts such as Linux, I use kermit, less, and jove, all at once, and can do most of the things VersaTerm-PRO does. I used VersaTerm-PRO to ftp Linux for the PC.

4104. Re: Pulsed BPSK hoax?(???)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-10 21:56:05 UTC
From: karn@unix.ka9q.ampr.org
Message-ID: <39u4tl$133@qualcomm.com>
Source record: 46549

I've been asked for a more complete citation for the Costas paper.

It's "Poisson, Shannon and the Radio Amateur", and it first appeared in the December 1959 (!) issue of Proceedings of the I.R.E. It was reprinted as the first paper in the 1993 IEEE book "Multiple Access Communications: Foundations for Emerging Technologies", edited by Norman Abramson, ISBN 0-87942-292-0.

Here's the abstract. --Phil

Summary - Congested band operation as found in the amateur service presents an interesting problem in analysis which can only be solved by statistical methods. Consideration is given to the relative merits of two currently popular modulation techniques, SSB and DSB. It is found that in spite of the bandwidth economy of SSB this system can claim no over-all advantage with respect to DSB for this service. It is further shown that there are definite advantages to the use of very broadband techniques in the amateur service.

The results obtained from the analysis of the radio amateur service are significant, for they challenge the intuitively obvious and universally accepted thesis that congestion in the radio frequency spectrum can only be relieved by the use of progressively smaller transmission bandwidths obtained by appropriate coding and modulation techniques. In order to study the general problem of spectrum utilization, some basic results of information theory are required. Some of the significant work of Shannon is reviewed with special emphasis on his channel capacity formula. It is shown that this famous formula, in spite of its deep philosophical significance, cannot be used meaningfully in the analysis and design of practical, present day communications systems. A more suitable channel capacity formula is derived for the practical case.

The analytical results thus obtained are used to show that broadband techniques have definite merit for both civil and military applications. Furthermore, such techniques will result in far more efficient spectrum utilization in many applications than any practical narrow-band, frequency- channelized approach. Thus broad-band techniques can, in many cases, increase the number of available "channels". With regard to military communications it is shown that the ability of a communication system to resist jamming varies in direct proportion to the transmission bandwidth for a given data rate. Thus narrow-band techniques lead progressively to more expensive communications equipment and less expensive jammers. It is concluded that in the military field broad-band techniques are not only desirable but also often mandatory.

I just came up with an another analysis of K6HH's scheme that shows that even his bandwidth claim is bogus.

You can model his "narrow shift" BPSK as the sum of an ordinary antipodal (0/180 degree) BPSK signal plus a much stronger unmodulated carrier component that is in quadrature (90 degrees) to both BPSK phases. In his case, the amplitude ("voltage") of the carrier is approximately 1/.01=100 times that of the BPSK component. That's a carrier/information power ratio of 10000:1 or 40 dB, with all of that carrier power going to waste because it doesn't carry any information. This means a 40 dB power loss vs ordinary BPSK, which is the same result I got last night.

It's obvious that the bandwidth required by the tiny BPSK signal is not reduced at all by the addition of the strong carrier component. It still requires 2 Hz per bit per second, as for standard BPSK. But look at how the FCC defines "bandwidth" in 97.3(a)(8):

"The width of a frequency band outside of which the mean power of the total emission is attenuated at least 26dB below the mean power of the total emission, including allowances for transmitter drift or Doppler shift."

By this definition, K6HH can claim that his system has *zero* bandwidth, because all of his sideband energy (the only information-carrying part) is 40 dB down from his useless carrier-on-steroids. That puts all of the sidebands outside of the FCC-defined bandwidth. All that's left is the carrier, which has zero bandwidth and carries zero information. The sidebands don't count in the bandwidth measurement, even though they're still absolutely necessary to demodulate the signal.

Again, this is a pretty good example of why minimizing transmitter *power* is so much more important than bandwidth. Not only should the FCC get rid of bandwidth limits in favor of automatic power control, there should also be an upper limit on the Eb/N0 that may be required by any particular modulation technique. This will avoid the gratuitous interference that could otherwise be caused by using a highly power-inefficient modulation method and cranking up the wick to compensate.

Phil

With the docs, well there are somefloating about here,but the translater
said that they were copyright!, this is sort of ture, I think the early version
of baycom that first came was shareware and had english docs with them,
so you need to find someone with an early version!!, The later versions
of Baycom are copyrighted, this I know! As the german gents sometime
ago was talking about taking people to court (Shareware vendors etc) who
were giving away this software, I don't know what is happening know though
I do know people with the baycom, and I'm sure you will get lots out of this
part of the hobby.

I bought one before I bought my present notebook computer. I used it on a bigger laptop and it worked fine. Because it runs off voltage from the serial port, when I upgraded my computer, I found it wouldn't get powered up. I checked everything and even called the manufacturers for help but they were baffled as well. I believe it was from a lower voltage offered by the serial port itself that was insufficient to drive the modem. As it turned out, I checked the voltages on my previous computer serial port and the new one and found that the voltage available on the first one was about 11 volts and was only about 9 from the new computer. You'd think that this wouldn't be too much of a difference but I think it was. It ran on the other machine but not on the new one. I even had some other HAMs in the area try it and they all got it to work on desktops. If it had been able to run on my laptop, I would probably still have it. It is a very nice package but make sure that your serial voltage is over 10 volts. It is still in use around here somewhere but I had to sell it and go for something a bit bigger. I would like to have it back now actually because I run NOS programs and they don't make use of the features of the big TNCs at all so it would be a great thing to run that with.

If your regular phone modem happens to be a Bell 202 leased line dumb
modem, and if your serial port has an HDLC chip (the Mac does), then
sure you can use your telephone modem. Otherwise, you're out of luck.

Gary

None that I am aware of. To get an inteligable voice of a Digital path
requires somehting on the order of 13,000 bps. The most common speed is still
1200bps.

Keith,

If you computer has a RS232 port, than consider using just
a modem. Mine cost only 15 $ to build and 70$ to buy.
It is also known as a Poor man's packet or as the Baycom modem,
and there are several FTP-able drivers for it around.
Also, itis directly powered from the port.

73, Moritz

----------clipped----------

Keith - Check out the KPC-3 by Kantronics. I use a HP-95, and Alinco DJ580 HT and the KPC-3 as my portable packet station. Why the KPC-3? Well, I am no packet expert but here are my "pros":

-- Small size (about the size of a 5 1/4" diskette and about 3/4" thick.
-- Ckt board ready for a 9V battery clip (you have to install it yourself)
-- Low power draw (can turn LEDs off for futher power reduction)
-- Built in KA NODE
-- Built in PBBS
-- This TNC can be connected to remotely (password protected) and you get access to the command prompt which means easy tweaking of a portable digi or node.
-- Easy RAM upgrade ($20 for 128K)

There's lots of good documentation and a large user base! There are more "pros" which someone will jump on, but these come to mind first. Oh, and the price? EEB in Vienna, VA carries it for about $109, I'm sure others have a similar price...

The KPC-3 is used almost exclusively by our local ARES folks involved with digital comms. Many use the HP palmtops and HTs which makes for an impressive, compact, low power portable packet station! Good Luck!

Best wishes-
Dan Velez N4WZR

Hmmm...

Low power
Cheap
HTx-202

Sounds like you need a Kantronics KPC-3 to me. Runs forever on a 9-volt
battery and virtually plug and play with an HTX202, about $120, Only
negative?.. not a kit.

Try the Kantronics KPC-3. It's small, full featured, can be run off
of a 9V battery, and costs about $120.00, new. (And it beats the heck
out of the Baycom-type modems, which are the most common "kit" TNC's
around.)

Yep.

The attempt at a theoretical explanation fails outright, and
>the experimental data is IMHO inconclusive at best.

Yep.

Thus my questions
>are: Does any of this make sense?

No.

Are there any "obvious" signs that
>such a narrow bandwidth is flat out impossible? (Everybody I've
>mentioned it to immediately thinks it's impossible, after which they
>sit around scratching their head for a while...)

I'm not familiar with the article but from your description it sounds like
ordinary bpsk with a very low modulation index. Regardless of the method
of encoding the bits, +- 1.2 degree phase shift bpsk will result in much
less than 1 percent of the total energy showing up in the sidebands and
the rest (over 99%) as _unmodulated_ carrier containing no information. The
bandwidth of the sidebands will be the same as any other bpsk signal at
the same symbol rate which will require a bandwidth of approximately eight

times the bitrate to contain 99% of the sideband energy. Since less than 1 percent of the carrier power shows up as sidebands, one could easily be fooled into thinking the signal was of low bandwidth but in fact it is a horrible waste of carrier power compounded by one of the least bandwidth efficient methods of modulation.

The only way to get multiple bits per second per Hz bandwidth is to use some sort of multilevel modulation, encoding multiple bits per transmitted symbol. This will allow the modulator more time to change from one symbol state to the next decreasing the required bandwidth. Instantaneous transitions will cause wide bandwidths. Some systems work by allowing the modulator to transition instantly and then removing the high order sidebands by filtering with a bandpass filter. This method requires linear amplaification for all subsequent stages and will increase the power required by the transmitter.

It's very simple to make one. Just copy the instructions for the ICOM 2at, 2sat, etc and use a 2.2k resistor instead of the one they specify. If you can't solder, you can buy pre made cables from radio shack, cut them in the middle, and twist and tape. This would still be cheaper significantly cheaper than buying a pre-made mfj one.

N.B. R/S sells "twist on" solder, you wrap it around the joint you want to solder and heat it with a match.

Since you are posting from america online, it is impossible to figure out where you are. If you would include you location in your signature, you might get some offers of help from local hams. If you are near Philadelphia, I would be glad to help you, I could teach you how to make your own in an afternoon.

73,

Geoff.

Hi All

The latest BPQ408.ZIP is available by anonymous FTP to cfcsc.dnd.ca. This is posted as some people are having some difficulty accessing the UK site.

Also available is latest Canadian Callsign database issued in November by the Canadian Department of Industry and Science. This data can be accessed using a program called RD-FBB27.exe - which also contains files and how to access the data using fbb BBS software as well..

There is a school close to me wondering if there is a market for used Commodore computers. I told the teacher I'd see if hams were still intrested in these boat anchors as packet computers. Are they still used and could a school unload some of these at auctions or flea markets without much trouble. What is the going price? Thanks!

Well, Keith, I can recommend the Kantronics KPC-3 to you. I have both an MFJ-1270B and the KPC-3 here. I have had the 1270B for several years and just a year or so ago added a second TNC. (the KPC-3) I run TCP/IP 24 hrs/day with 2 ports. I am very impressed with the KPC-3 in all of it's features. It even has a command to shut off the front panel LED's and has room inside for a 9V batt and draws *very* little current in that mode. Great for portable work! It would probably run for several days on a batt in that mode, I'm sure. The KPC-3 is about 1/4 the size of the MFJ and both are priced under your $150 limit.

Hope this helps and I think you will enjoy Packet Radio.

After doing some reading about satellites, I understand
that they actually "repeat" a range of frequencies
(instead of just one) to another band. Could someone
please explain to me why 2m type FM repeaters only repeat
one frequency. Why couldn't the repeater take 100kHz from
145.0 to 145.1 MHz and repeat it to 145.6 to 145.7 MHz? It
seems to me that this would allow the "repeater" to handle
several simultaneous conversations, just like satellites.

I would appreciate anyone who could explain this to me.

Can anyone tell me if there is a way to use a standard
telephone style modem on the air or am I required to
use a packet radio modem? My question stems from a desire
to use a specialized software package over the airwaves.
I have a teleconferencing audio/video system that allows
me to use a video camera and a computer to send digitized,
compressed semi-live video (7 frames/second) over the
telephone lines to another computer. The system is designed
for standard 28,800 baud V.Fast modems. Is it possible to
use this system on a 2m or 70cm band?

Message-ID: <3a6oie$e9o@newsbf01.news.aol.com>
Source record: 46391

Help needed on solving the problem of multiple serial port connections. My
last computer had a parallel mouse and left just enough room. Anyhow
problem is this......
Mouse is com1
internal modem is com2
I know that Com1 and 3 share same irq and 2 and 4 share same irq. I
bought a serial card that has addressable com ports. I have the serial
cards two external ports set to Com 3 and com 4. The mouse has its own
connection off of another board as com1. If I put the kam+ tnc on com 4
then there is no conflict between the tnc and internal modem as long as I
don't use the modem. So far so good.
Now I have this rs232 interface from Kenwood which I think needs a com
port to control the TS850 for the logging pgm etc. If I hook it to com 3
then since the mouse is always being used won't I have a problem. As I
mentioned the last computer I had (lightning got it) had a parallel mouse
(or some other than serial because it did its own thing on a separate
board). I think I have the comport info correct but I really need help on
this one! I don't think any of the devices uses a lpt port so what do I
do? In a nutshell how do I connect a tnc, rs232 computer/rig interface,
mouse, and internal fax/modem so that they coexist without conflict. I
remember that my pkgold pgm allows you to address the com port thru
software. (I have been off packet due to the lightning strike to the shack
for over a year now) The extra addressable serial card provides some
flexibility but I am still in a fog! HELP PLEASE! FROM A FRUSTRATED WANNA
BE EX- PACKETEER

4157. BPQ & NOS using wire link

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-14 05:11:26 UTC
From: dj1@vax1.mankato.msus.edu
Message-ID: <1994Nov14.001126.1@vax1.mankato.msus.edu>
Source record: 46589

Hello,

I am attempting to configure BPQ and NOS together on seperate machines.
I am running BPQ underneath FBB on one system with all of the radio ports. I
am using com1 to talk to the second machine with nos. Currently I am using
KISS to have each machine talk to each other. Is there a better way then this?
It seems kinda silly to also pass along the overhead of ax25 over a wire link.
If you have any ideas I would appreciate them.

Thanks..

Sean / N0PBA

4158. The Amateur Radio BBS...

+--------------------------------------------------------------------------+
HOW TO ACCESS THE WB3FFV AMATEUR RADIO TELEPHONE BBS !!!

I have placed a BBS system on-line that is mainly oriented towards the
Amateur Community (but there are plenty of other wares on-line). Through
user support I hope to keep the latest and greatest ham software on-line.
The BBS also offers access to nearly all of the Internet (USENET) NetNews
groups, plus access to Internet E-Mail. Below is the information that is
needed in order to access the BBS via Telephone, Telnet, or FTP. Please
pass it around to as many ham's as possible.

System Name: WB3FFV
User Login: bbs

410-661-2475 - 12/24/48/96/14.4/16.8/19.2/21.6/28.8
(V.32bis,V.32terbo,V.34,V.FC,HST,V.42bis)

410-661-2598 - 12/24/48/96/14.4/16.8/19.2/21.6/28.8
(V.32bis,V.32terbo,V.34,V.FC,HST,V.42bis)

410-661-2648 - 1200/2400/4800/9600/14400/23000
(MNP2-5, V.32bis, V.42bis, Turbo-PEP)

TELNET/FTP - wb3ffv1.sed.csc.com (20.2.1.80)

Data Settings: 8 Bits, NO Parity, 1 Stop Bit
Times: 24hrs/365days (except for routine maintenance)
Software: UniBoard UNIX BBS Software (Version 1.30b)
Misc. Info: Machine is an Pentium-90/MP running UNIX System V Release 4.2
and features more than 4 Gigabytes of on-line file storage.
Most transfer protocols are available!!

I attempt to keep the latest and greatest HAM software on-line, and encourage
all to upload anything new that they come up with, as it is of benefit to all.
Here is a sample of a couple pieces of software that is available for DOWNLOAD:

KA9Q TCP/IP Software for the PC (Latest OFFICIAL release + TEST Versions)
KA9Q TCP/IP for the Atari-ST, MAC, & Amiga
KA9Q TCP/IP for UNIX based systems
KA9Q TCP/IP (The NOS release) [UNIX, MS/DOS, Amiga]
KA9Q TCP/IP (Version by G1EMM, PE1CHL, PA0GRI, Etc.)
N2GTE Packet Message Switch [GTEPMS]
WA7MBL BBS for the PC
W0RLI BBS for the PC
MSYS BBS for the PC running KISS TNC's
AA4RE BBS for the PC (plus BETA versions)
F6FBB BBS for the PC
```

G8BPQ PC-Node (Version 4.08)
Various BBS utilities and enhancements
Several MORSE CODE Tutors
TheNet software by NORD><LINK
Modifications for many HAM Rigs and Scanners
Digital Signal Processing software (DSP)
DX and contesting programs

If you are interested in using UUCP to connect to the BBS, this can also be done as I support Anon-uucp. The login to the system is 'uucpanon', and there is NO password. The listing of avalible archives are stored in a file called 'FILES', and it is located in the /var/spool/uucppublic. To retrieve the files listing just use the following command:

uucp wb3ffv!~/FILES /usr/spool/uucppublic (ASCII Text)
-or-
uucp wb3ffv!~/FILES.Z /usr/spool/uucppublic (16-Bit Compressed)
-or-
uucp wb3ffv!~/FILES.gz /usr/spool/uucppublic (GNU Gzipped)

This will move a copy of my files listing into your uucppublic directory.

If you want to access the BBS via Telnet all you have to do is TELNET to wb3ffv1.sed.csc.com, and login is 'bbs' with no password required. To use anonymous FTP just ftp to wb3ffv1.sed.csc.com and login as 'anonymous'. This system is currently attached to the Internet via a dialup SLIP link, and should generally be available 24hrs, but at times the modem will drop the line. Also since this isn't the fastest link, I will be limiting the maximum number of anonymous sessions for the moment.

If you have any questions or problems, feel free to contact me at one of the numbers/adresses below. Good Luck...

4159. mobile applications

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-14 10:37:00 UTC
From: maurizio.colombo@galactica.IT
Message-ID: <89DB2B9.0001004378.uuout@galactica.it>
Source record: 46418

I am involved in a project for the use of VHF and UHF radios in a
vehicle tracking system.
I have experience with TNC's for fixed use, but I think they are not
suitable for mobile applications, because connection oriented protocols
as AX25 are not very efficient in mobile applications where messages are
short and fading may be severe.

I am evaluating two possibilities:

1. Using a TNC with MSK modulation (1200/2400 bit/sec) with AX25
"Unnumbered frames": I know that APRS uses such a method (with
FSK), but I don't know the performance.

2. No TNC at all, and a protocol like MPT1317 (UK) or ETSI 300-113
(European Standard) which are more specific for mobile use, but in
this case I'll need more developing time.

Does anybody on the net have experience in mobile-data applications?

Thanks in advance

4160. AFSK tone for 2400baud Packet ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-14 10:39:28 UTC
From: victor@ibpm.serpukhov.su
Message-ID: <victor.32.0@ibpm.serpukhov.su>
Source record: 46395

Hello ALL

I read about NEW 2400bps radio modem from MFJ and other.
What's tone standard for Amateur Packet on 2400 ?

I believe that they use some higher AFSK tone than on 1200bps.
I heard about 3658/1996 Hz. Is't true ? Or maybe there no any
standard yet...

I'am try play with TCM3105 on 2400 (it work if S/N is good) and will
set up true tone.

Tnx in advance, 73! de RX3DIN Victor

: None that I am aware of. To get an inteligable voice of a Digital path
: requires somehting on the order of 13,000 bps. The most common speed is still
: 1200bps.

Well I beg to differ ... 4.8 kbps fed standard CELP does a pretty good
job at regognizable voice - that is you should be able to recognize
the speakers voice when you hear it. Toll quality (subjectively
the same as 64 kbps PCM) is done with ITU standard G.728
in 16 kbps.

With plug and play 9600 bps radio/modems available for the Radio
Amateur now ... digital voice should be doable for the average Ham.

With something like the GRAPES 56 kbps Modem and a few other
bits you could easily support the same amount of voice trafic
that is carried on all of 2m in most metro areas:-)

In principle you could do it. In practice, there are some problems. Terrestrial repeaters generally operate in band. (The input and output frequencies are in the same band, 600 KHz apart on 2m for example.) You will notice that most (if not all) spacecraft operate cross band (2m in, 10m out, etc.)

One problem is that you have to keep the transmitter signal from overloading the receiver. Cross band this is pretty easy, as demonstrated by the full duplex handhelds now on the market. Within a single band it is a much more difficult job. At 2m, terrestrial repeaters use large and expensive multistage coaxial resonator filters to reduce the transmit signal enough at the receive frequency (600 KHz away). Actually, TWO filters are typically used: one centered on the transmit frequency and one centered on the receive frequency. The filter passbands are just wide enough to allow a 10 KHz or so FM signal. To increase the passband to 100 KHz yet maintain the same stopband attenuation at 600 KHz would greatly complicate the filter system. It probably isn't practical at 2m, at least with the standard 600 KHz repeater offset.

At 440 MHz, filtering is practical. In fact, much wider (say 5 MHz) ATV repeaters are fairly common in this band. However, another problem crops up, one which is shared by the satellite transponders. The transmit power has to be divided up somehow among the simultaneous users at any given instant. For a linear translator, such as the earlier OSCAR satellites and RS10/11, transmit power is allocated on the basis of received signal strength. In other words, who ever puts the most signal into the transponder gets most of the signal out. (Contrast this with terrestrial repeaters where users take turns at all of the transmit power.) Each spacecraft transponder has some favored receive signal level and users are supposed to match this by controlling antenna gain and transmit power. This is supposed to result in all the the transponder input signals being at about the same level and the transmit power divided up fairly among the satellite users. It may actually work occasionally :-)

To expect this with terrestrial stations is pretty optimistic. In terrestrial operation, you will easily see signal levels varying 30 to 40 dB, or 1000 to 10000) at a repeater receiver input. This results from the varying distances, transmit power, and antenna gains. (Cellular telephone systems have an automatic power control system to solve a similar problem. The cell base station sends back power control signals to the portable units.) Just imagine yourself 40 dB below Kilowatt Kevin all the time at the transponder output.

In summary, it could be done but probably isn't worth it for narrow band FM. An interesting question would be whether the situation is any different with spread spectrum systems.

4168. Baycom will, SP/GP+TFPCX will not connect, vice versa also.

Hello ALL!

I have an interesting problem here.... There are a few sites that I can connect to using the Baycom software with my Baycom modem that I simply cannot connect to using the TFPCX.EXE+SP/GP combinations, and at least one station that I can connect to with SP/GP that Baycom will not connect to. I am really puzzled by this one.

Can anyone using a Baycom type modem with TFPCX+SP/GP send me a copy of their configuration files to give me a hand? One with comments translated to english would be most helpful. :) Also some good recommendations on the TNCINIT parms would be most helpful... I am thinking that is where the problem lies, but I'm not sure.

Thanks!

4175. Channelization on HF

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-14 22:00:56 UTC
From: rick_whiting@atk.com
Message-ID: <1994Nov14.220056.22539@omega.atk.com>
Source record: 46420

I recall it has been suggested that the 500 Hz bandwidth proposed for semiautomatic unattended operation (U.S.) on HF originated from an idea for "channelizing" digital operations to reduce interference. Regardless of the merits (or lack thereof) of establishing a limit on bandwidth, I wonder if channelization really would increase throughput on HF under the scenario described below.

Intuitively, channelization would benefit CSMA modes, e.g., AX.25. But it is not clear (at least to me) that channelization will necessarily
provide the greatest throughput for the most users of a given HF sub-band for non-CSMA modes, particularly those employing FEC. It strikes me that for protocols such as PACTOR and G-TOR it might be possible that more stations would pass more total data by the somewhat unstructured process currently employed, i.e., find the least noisy channel and "jump in." It would be interesting to see the results of a simulation of both channelized and non-channelized operation given realistic band conditions and station geographic distribution.

Of course, if the idea is to provide the best possible throughput to a limited number of stations at any time, then "rationing" operation to (clear) channels will provide maximum available throughput for the lucky few. But, laying aside the philosophical question of quality vs.

quantity, is there any answer to the original hypothesis that non-channelization will maximize total throughput on HF in a real world scenario of "many" pairs of stations attempting to communicate?

4176. Taking in Digital

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-14 23:59:13 UTC
From: starin@netcom.com
Message-ID: <starinCzA7yp.KwA@netcom.com>
Source record: 46422

I'm not really that familiar with digital systems, but I believe what I'm looking for must exist somewhere. I have the ability to feed digital signals into my computer, and would like to display this raw data on the screen. Are there programs which will monitor, say, a serial port, and then print to the screen the data streaming in? I am not interested in those products that display a voice pattern or wave, but rather something that will display the raw data for later conversion. Now, understanding before hand that I'm a real novice at this, is this a ridiculous question? Am I out in left field? I've seen and read about products that will produce a graphic fascimile of digital information, like those programs that come with a sound blaster. But, as I mentioned, I'd like to see the raw data and I can get it into the serial port, just have a problem getting it to the screen.

Thanks in advance. Please post here, or e-mail me directly if you can help.

Actually, any terminal program will monitor the port. You can use
ProComm, BitCom, Windows' Terminal, etc... They more or less echo
everything on the screen...

However, if you want to monitor numerical values, instead of text, you
might have to write your own program. In BASIC, it is simple, but slow...

Anyway, give me a yell if you have any questions I might be able to help
you with!

From: ablackbelt@aol.com
Message-ID: <3a92lr$sbh@newsbf01.news.aol.com>
Source record: 46425

Help needed on solving the problem of multiple serial port connections. My last computer had a bus mouse and left just enough room. Anyhow problem is this......
Mouse is com1
internal modem is com2
I know that Com1 and 3 share same irq and 2 and 4 share same irq. I bought a serial card that has addressable com ports. I have the serial cards two external ports set to Com 3 and com 4. The mouse has its own connection off of another board as com1. If I put the kam+ tnc on com 4 then there is no conflict between the tnc and internal modem as long as I don't use the modem. So far so good.
Now I have this rs232 interface from Kenwood which I think needs a com port to control the TS850 for the logging pgm etc. If I hook it to com 3 then since the mouse is always being used won't I have a problem. As I mentioned the last computer I had (lightning got it) had a parallel mouse (or some other than serial because it did its own thing on a separate board). I think I have the comport info correct but I really need help on this one! I don't think any of the devices uses a lpt port so what do I do? In a nutshell how do I connect a tnc, rs232 computer/rig interface, mouse, and internal fax/modem so that they coexist without conflict. I remember that my pkgold pgm allows you to address the com port thru software. (I have been off packet due to the lightning strike to the shack for over a year now) The extra addressable serial card provides some flexibility but I am still in a fog! HELP PLEASE! Technically, it's a excellent mode. The way it's currently used, it
s%%%%. The BBS stations will refuse connects from non-BBS stations.
The few live-operator stations jam onto one frequency and then see
how many stations they can connect to at one time. Most TNC's allow
9 users. The result is that they get to exercise the daylights
out of their software, make a pretty picture on their PC's, and pass
virtually no packets due to QRM (= packet crashes).

The FCC may (anyone know if/when?) permit unattended HF packet
operations, which would allow mail drops between friends. The ARRL
(if I'm not mistaken) wants to restrict these operations to
about 50 hz per band, so we'll all wind up with our TNC's on the
same frequency jamming each other, and passing no packets.

We use low band packet to link our local BBS to the BBS network
in Alaska. Range to the nearest node is about 350 miles.
We link in automatically on 40m and manually on 80m. It is about
as reliable as you can get on HF in the the arctic. When conditions
are very good we have problems with broadcast stations on 40m.
When conditions are poor (frequent auroral HF blackouts) nothing gets
through. However with automatic stations trying to link 24 hours a
day the traffic usually gets passed. The link on 80m is difficult
due to local QRN but a guy that lives outside of town with no QRN
is getting an 80m gateway set up.

Good luck,

I have been using one for about five or six years with no difficulty
whatsoever. I am using a commercial battery (like a car battery, but different
current delivery) being charged by a little lab supply trickling, but for a
while I used the internal. I stopped that because the battery didn't like
being charged all the time. Other than that, the internal battery would be
fine.

>throughput on HF under the scenario described below.

Hi Rick,

If my 2-meter transmitter is off by 1 kHz, it's no big deal. But if I
am off by 100 Hz on 20 meters (same percent of error) then I would
probably have trouble making an FSK contact without doing some
fine-tuning. Channelization might be good for unattended stations,
but for other cases it seems like tuning for a clear spot is the best
way to get data through, especially if there is QRM from voice, CW,
SSTV and the like.

|>
|> Please don't.
|> It creates an increadible amount of world wide QRM.

As does RTTY, CW, SSB, ...

|> Use 10m, when it is open.

Where it also would create the same QRM, were the band open,
just like RTTY, CW, SSB ...

But that didn't answer the question, which was "Does it work."

The answer is yes, it works, but not very well. Other digital
modes, in particular clover, g-tor, pactor and amtor work
a good deal better than packet on 80M.

However packet DOES work, and can be a lot of fun.

Enjoy !

4195. Very Local Area Networks

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-16 01:29:29 UTC
From: jcksnste@ACFcluster.nyu.edu
Message-ID: <3abn9p$r49@cmcl2.NYU.EDU>
Source record: 46433

Here's a thought.

My neighborhood just started a neighborhood watch program, and the thought crossed my mind of helping to bring my computerized neighbors closer together by using TNC's and short distance motorcycle style 49MHz radios.

Even if nothing more would come out of it than people saying 'hi' a little more often and my rerouting the recipe bulletins from packet, the faces around here would get names, and people might start to care more about the people around them.

How would the FCC take to using those radios for data? I wouldn't think of boosting the power of the radios, just using common sense (like roof mounted directional antennas). Do you think they could handle the 100% duty cycle?

Has anyone done this to keep in touch with ham neighbors without tying up the ham frequencies?

Interested in comments..

In article <1241.4296.uupcb@inno.com>
alain.bourassa@inno.com "Alain Bourassa" writes:

> I want to know what does an SCC card do ?

It's a a card equipped with Serial Communications Controller's (usually 2 or 4 channels (but can be more)). These do HDLC directly, thus relieving the host CPU from the overhead of doing it in s/w (as in the Baycom + serial port). There are ESCC chips too for even faster speeds or put another way, less interrupt loading on the host, due to larger Rx/Tx buffers.

> And It could improve a packet station based on a Baycom modem ?

Depends how much CPU time your machine is having to put in to do the work you ask of it now - if it struggles, then yes but if there's plenty of time to spare, then no.

Cheers, Martin.

I'm intereseted in experimenting with HTTP over amateur TCP/IP. Lose the embedded graphics from your HTML pages and I think that a WWW server would be a useful addition to the ham toybox.

I run KA9Q NOS on an HP100LX palmtop and use it regularly to exchange files with and back up to my PC via a serial line running SLIP. Just for grins I have tried using Mosaic and Cello on the PC to access the NOS FTP server on the 100LX, which works just fine. I have no reason to assume that this wouldn't also work on the air, except possibly some timeout problems.

While I've never hacked NOS before, I have experience designing and building HTTP servers, and have considered building an extremely simple HTTP server that would run as a NOS service. For the client side I would propose to nab a copy of the DosLynx source code and see if it's feasible to graft it onto NOS, too.

Has anybody else tried anything like this?

Greetings...

I bought a MFJ1274 TNC some months ago which supports KISS and FAX.
These are both documented. However, on power-up, I also see in the
text that it supports BLP. Can anyone please enlighten me as to what
BLP is or does.

Thanks in anticipation...

BLP is a host mode which is built into the firmware in TAPR 1.1.8 and the MFJ equivalent. A disk is available from TAPR with details and some rudimentary routines to interface with it. To my knowledge, nobody has written any software to fully utilize this mode.

Have you considered GMRS radios? Or is that beyond your budget
limitations?? ;-))

>How would the FCC take to using those radios for data? I wouldn't think of
>boosting the power of the radios, just using common sense (like roof mounted
>directional antennas). Do you think they could handle the 100% duty cycle?

Again, if your pockets are deep, you can implement a spread-spectrum based
computer network. I've got four of us (within 5 blocks of each other) on-line
using Windows For Workgroups over a SS RF LAN. This cost us serveral thousand
bucks but it sure if fun! We also have digitized voice going across (semi-real
time, a few seconds of delay) via 16-bit sound cards.

License-free SS modems (with about a 30 mile range if you have point-to-point,
line-of-sight beam antennas) can be had for around $1000.00 (not cheap, I
know). Measured in Bits/second/dollar, it's a better deal than most amateur
radio stuff and, again, requires no license. Of course, you need TWO SS
modems to implment EACH RF network connection back to the server.
And you can send ANY kind of data you want and use encryption too! :-))

Have you considered applying for government aid?? This is probably
possible, no?

: why the heck are TNC's so bloody expencive? and a kit a saw was only 60$...
: i don't get it, what MAJOR advantage does an ordinary TNC have over a kit tnc?

Probably that most of the 'kit' TNC's are nothing but a non-intelegent
modem. This type of computer/radio interface depends on the computer to do
all the reconstruction and status tracking of the packet protocol, for both
sending and receiving, in the computer. If the computer is not on and
running the packet software, your station is off the air.

Most of the 'expensive' TNC's have a built-in microprocessor and memory.
The memory is virtually always battery backed. So the TNC is able to
operate even when your computer is off, and is able to store messages others
may leave for you. The TNC is able to do all the work needed to support
on-air connections. Hope that gives you a little idea.

: thanks....

[stuff deleted]

: The only way to get multiple bits per second per Hz bandwidth is to use
: some sort of multilevel modulation, encoding multiple bits per transmitted
: symbol. This will allow the modulator more time to change from one symbol
: state to the next decreasing the required bandwidth. Instantaneous
: transitions will cause wide bandwidths. Some systems work by allowing
: the modulator to transition instantly and then removing the high order
: sidebands by filtering with a bandpass filter. This method requires
: linear amplaification for all subsequent stages and will increase the
: power required by the transmitter.
^^^^^^^^^^^^^^

Just a little clarification here - the rating of the PA will need to be
more. In other words to transmit a 5 Watt signal, you will need
a PA rated at least 10 Watts to keep the amp in it's linear range.
(assuming that the amp is a solid state linear amp). Of course you
will also loose some power in the filters, but more will be lost
trying to keep the signal linear.

Adding 9600 to most any voice radio requires internal connections
to the modulator and demodulator. The HTX-202 is no exception. If
you feel confident in doing micro-surgery on your HT, then the KPC-9612
is a nice TNC.

Beyond groundwave range, selective fading and QRN plague 80 meter packet
at 300 baud. At 50 baud, it works much more robustly. The higher bands
are generally better.

>i don't get it, what MAJOR advantage does an ordinary TNC have over a kit tnc?

The $60 "kit" is a single chip modem used with bit banging software. In essence, you're using a $2300 486 computer to emulate what a $120 TNC would do. A TNC includes a modem, HDLC hardware, and a PAD (Packet Assembler Disassembler). The modem is typically either PLL or filter based, much better than the zero crossing detector of the typical bit banger. The HDLC hardware removes the requirement for interrupt per bit servicing by the computer, thus allowing much higher speeds. And the PAD, usually implemented in a Z80 CPU, relieves the computer of handling the low level AX25 protocol and channel management.

This leaves the computer free to be either a terminal emulator (a waste), or free to actually run some useful application that uses packet communications channels.

4213. Windows JNOS

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-16 16:10:13 UTC
From: ttrostel@shl.com
Message-ID: <CzDBL2.5qq@tornews.shl.com>
Source record: 46472

A while back ... I saw in the notes about JNOS that the next released version would be written to run under Windows. For all of you who don't know ... JNOS is a TCP/IP program for packet which will interface to just about every KISS TNC on the planet. I've been using it for a while but most of my stuff is wandering tword Windows and Windows NT.

Thanks in advance ;)

>too.

For the Mac, it would be a matter of writing a module to work with MacTCP.
MacTCP comes standard with modules that work over LocalTalk and ethernet,
and 3rd-parties have written modules that do SLIP and PPP over serial
lines. Once you plug in the appropriate module, the existing ftp, http,
talk, etc. servers for the Mac, as well as all the client software
(Mosaic, Netscape, Fetch, Anarchie, Newswatcher, NCSA Telnet, etc.), would
work automatically over packet. You could throw away all the NOS code
that implements the servers and the multitasking (and even a lot of the
TCP/IP stuff) if you could just glue the core code to MacTCP.

Packet message forwarding sites running high power with large antennas
are successful on HF, though I find more and more of them are converting
over to PACTOR, Clover and now G-TOR, because of higher throughput,
particularly on 80 and 40 meters.

If you are interested in having a QSO, then packet on the lower HF
band frequencies is a very poor mode of communications. Multi-path
propogation is particularly destructive on 80 meters. You will have
much better success using AMTOR, PACTOR, or G-TOR here. RTTY (Baudot)
is still used, though has no error correction, and is inferior to
the other digital modes (exception being PACKET) for a 2-way QSO.

This has been my experience on HF, I'm excluding CW from discussion,
though I enjoy it very much, and it could be considered a digital
mode by some.

Good Luck with which ever mode you choose to use.

Bill (N4LRA)

I do telephone tech support for a computer manufacturer, and today was the
first time I have ever seen four serial devices on a single DOS machine..

COM IRQ
1 4
2 3
3 5
4 2

Be careful with IRQ 5 as that is also used for LPT2.

Good luck, and don't listen to the naysayers.

I am having difficulty with Savant and SoftKiss on a Macintosh PowerBook Duo 230. I cannot communicate with the modem (PacketMac). The system behaves as if I did not set SoftKiss to Kiss mode (which I did). The transmitter key and stays keyed and I cannot send or receive any packets. The same software and setup works fine on my Quadra 800. Anyone have any ideas? Here are the specifics:

Mac PB Duo 230
System 7.5
SoftKiss v1.8
Savant v1.0.2
PacketMac modem

Thanks in advance!

Well, for starters, the kit for $60 is probably a Baycom or equivalent and
it's not a TNC...just a modem. You then need a several-hundred-dollar PC
to make it work. A stand-alone TNC doesn't need a computer...it's smart
enough to hanlde it all itself. Besides, you can probably find a good
used TNC for not much more than $60. A KPC-3 can be had new for about $100.
I've never understood why someone would shell out >$60 for a Baycom type
unit when you can get a real TNC for about $10 more (for a used PK-88, etc.).

We have been using YT3MV 23 cm radios with G3RUH 19,2 kbps
modems succesfully for a longer period. However, we miss
the part in the original series of articles where the
modified TNC design and 38,4 kbps manchester coded modems
are described.

The articles have been published in the Italian magazine
'CQ Elettronica' some years ago. If somebody out there
would be so kind and send us copies of the missing part,
we would be most grateful. Copying and postal expenses
will be reimbursed in green stamps, IRC's or any which
way you want.

Isn't 60ms a bit high? I was under the impression that the Motorola Moxie (Moxy?) could do it at around 25ms. Supposed to be a good, inexpensive radio for that purpose. My information is all second hand, however.

|>Fortunately you mention the modes that should be used.

I don't recall the orginal poster ever mentioning unattended operation, so
why drag that flame fight into a simple question, i.e. does HF packet work?

To answer the original question, yes, it works. How well depends upon
band conditions such as noise and propogation. Try it and see if you like
it.

: ---

Not really. The bandwith would be too big. I suppose that would not be
allowed under your regulations. It will not under ours (in Holland).
For "packet radio" you would need a special TNC, which however would
be too slow to send your video.

4237. DSP Using the Ultrasound Max ??? and more???

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-17 19:33:26 UTC
From: hadleyv@et.byu.edu
Message-ID: <3agb66$q95@bones.et.byu.edu>
Source record: 46487

I just recently recieved some information about the Gravis Ultrasound Max sound card for the PC. The card sound's exciting! It has simultaneous record and playback capability. and according to the literature, a "dedicated digital signal processor...more powerful than general purpose DSP's" It samples at 48 kHz in stereo at 16-bits too. Talking with one of the technical support personel, he says they have released the entire developers' kit to the public and it cost's nothing. This is available from their BBS at 604-431-5927. (The file name is gusdk221.zip). You can find an earlier release on the internet at:

Host faui43.informatik.uni-erlangen.de

Location: /mounts/epix/public/pub/pc/msdos/demos/programming/libs
FILE -r--r--r-- 926218 Oct 17 1993 gusdk201.lzh

The guy at tech support says that they have C code that will let you process things in realtime to create 3D holographic sound in the kit along with many other things. If this is possible to do this how about other things?

My question is the following:
Has anyone developed any programs using this card for realtime DSP for amatuer radio applications?

It would appear to me that using either the on board DSP unit or the math coprocessor on something like a 486/66 you could do some amazing things like:
-a Windows audio spectrum analyzer with point & click/drag to eliminate offending signals,

-Implement an algorithm that would "preserve" the wanted frequency and automatically eliminate a guy who decides to tune-up just up or down from you ...sort of a seek out and destroy idea

-recieve AND clean up SSTV transmissions in realtime all under Windows 3.1 displaying the image in one window and the recieved audio spectrum in another

-eliminate the need for an external device to do Pactor, Amtor, Packet, even G-Tor and possibly...Clover! (with a fast machine like say a Pentium?)...among many other modes!

-even experiment with other modes of digital processing in realtime! reducing development time and cost -utilize the vast amount of resources allready available or invested in on the PC (i.e. languages, toolkits, etc)

-You get the idea.... and all this for less than a dedicated DSP unit.

FYI, I no have affiliation with Gravis. (as you can by tell my late arrival to the scene in fingding out about this board) I just recieved a CD-ROM from them demonstrating its capabilites a couple of days ago and it is years ahead of soundblaster or anyone else on the market.

Source record: 46300

: do? In a nutshell how do I connect a tnc, rs232 computer/rig interface,
: mouse, and internal fax/modem so that they coexist without conflict. I

Hi ...
The question becomes one of whether the software running on your PC
can be set to an interrupt other than IRQ 3 or 4. For example, Procomm
allows you to define the port address and IRQ to _anything_. Of course,
you can't set it to just anything, but you have some IRQs left.
IRQ 7 and 2 or 5 are normally free. IRQ 7 is not needed by the printer.
Yes, there are situations where it is used. However, I bet if you used it,
you would find it would work. If it doesn't, try another. You also probably
have 2 or 5 depending on the flavor of your machine. If you have a XT, you
can probably use 2. Otherwise you can probably use 5. Yes, there are
situations where you can't use 2 or 5. Try it.
Now, how to try it. Many COM port cards (and all-in-one cards) have only
the copper fingers for the IRQs that are standard. Bummer. If you are going
to buy a COM card, try to find one that has all the copper fingers.
To find out which copper finger represents which IRQ ... the IRQ line is
a hard-wired finger, you need a chart of what pin is for what IRQ. There is
a chart included with MSYS, FTP to coffman.csuohio.edu. Unarc MSYS 1.16
and look for a file called something like IOBUS. The MS400 file is of
interest but you can not use that for what you want to do. Now, take and
find the line going from the IRQ 4 pin and, using a Dremel, cut and move it
to the finger for IRQ7. Set the card to use COM 3 or 4 (whatever) with IRQ4
(that is now wired to 7) and plug it in. Set the software for that address
and interrupt and off you go. In fact, somewhere in those same MSYS docs is
a way to rewire a card to another address. I have nine com ports on quite a
number of interrupts.
You may still have two problems. The first is that your software will
not be able to address other IRQs. Assuming that you read the manual a number
of times and tried a boot with the /h, /? or some other help switch, you
are now sure. Oh well. Call the author and crab. It is easy to use the
other interrupts.
You might not want to do the hardware work. Buy a switchbox.

In article <3a93id$sh8@newsbf01.news.aol.com>, ablackbelt@aol.com (ABLACKBELT) writes:

>Help needed on solving the problem of multiple serial port connections.

The following is a support file that I ship with my product, PacketPeT For Windows. It should be of some help to you:

This file supplies some information regarding hardware conflicts in PCs and their resolution.

HARDWARE CONFLICT:
Most PCs come with two serial ports standard, COM1 and COM2. Most users will have their mouse on serial port COM1 and their TNC on COM2. Usually these people who have a basic system without a lot of extra adapter cards will have no problem.

When you start adding other cards such as internal phone modems, tape backups, sound cards, buss mouse cards or CDROMs, IRQ conflicts can occur.

These problems are not caused by PacketPeT or Windows, but by the design of the PC and it's numerous adapter cards. Solutions to these problems range from easy to down right impossible. The solution can be stated in one sentence, and if you achieve the following goal, you will save yourself from many problems with serial ports and other adapter cards as well!

EACH DEVICE IN YOUR PC MUST HAVE IT'S OWN UNIQUE IRQ!!!

Don't get side tracked by tips on how to "SHARE IRQs". The author worked on this problem for many months and found the only reliable method (and a MUST for OS/2) is to make sure each serial port has it's own IRQ.

Check your computer hardware manuals and the jumper settings on your adapter cards to make sure no two cards have been configured to use the same IRQ!

Most adapter cards will have jumpers which allow changing IRQs to another number. It is important to note, that even if you change an IRQ, you must then install the proper software driver to utilize that IRQ!! Happily, Windows 3.1 and OS/2 2.x, support serial ports on alternate IRQs.

The author of PacketPeT has a PC with a sound card, a CDROM, and 4 serial ports that work simultaneously! This was accomplished by putting two of serial ports on IRQ10 and IRQ11, and going to the

Windows Control Panel Serial Port Advanced settings and changing the IRQs. This also works with OS/2 2.1, but the IRQs must be changed in the config.sys file (see your OS/2 manual).

When conflicts do occur, somebody has to move to a different IRQ, or be removed from the PC! Often, the easiest course of action is to move the serial port. Some serial cards can be configured for IRQs 2,3,4 and 5. (IRQ2 is really IRQ9 on a 286 or above PC). If you are not using LPT2, IRQ5 is often a good place to move your serial port to, but beware that a sound card or another adapter card may already be using IRQ5. IRQ2 may also be unused. Beware that since IRQ2 is "cascaded" on 286 and above PCs, that it is actually IRQ9, and you must use a software driver configured for IRQ9!

Hope this helps...

: received data on the packet modem's LED's. I can run Baycom onthe computer,
: BUT, taht's it. I can connect with myself on the computer, but if I put the
: Mic connector into the Tranciever, it locks it in transmit. I've checked the
: cables. I've checked the soldering. I called ramsey for some help. They said
: it's probably the connections going to the computer. I'm going to check to see
: if the serial port on the computer is active tonight. Other than that, HELP !
: Any support would be greatly appreciated. thanks. tyler N3SPD

I am not totally familiar with the HTX-202 but I know a few people using
them around here. I use a Yaesu HT for portable packet and when I built
the cable from the TNC to the radio, I had to put a capacitor and
resister in the TX audio line as the PTT and TX audio use the same line.
The capacitor keeps it from being constantly connected and the resistor
pads the TNC audio down so the HT can handle it. If you haven't connected
these components, then that's the problem. Put a .1uf cap and a 2.2 k ohm
resister in the PTT/TX audio line and it should clear it up.

Here's how it goes.

TX audio --------.1uf----------
|--------mic plug
PTT -------------2.2 k --------

Hope it helps.

Gary A. Mitchell (mitch@lexmark.com) wrote:
: I want to switch my DOS system running AA4RE BBS over to Linux.

: Is there a comparable BBS-like program for Linux? How about BPQ code?

I think it's N0ARY that has a BBS program for Unix systems and I thought someone was working on a Linux port of it. I could have the callsign wrong though.

JNOS v1.09 is ported over to Linux and it runs fine, but it doesn't have all the features that are in the latest JNOS code.

If you can wait a few days or so TNOS will be out for Linux too. This is a version of NOS with a lot of enhancements to operate as a BBS and also includes simple White Pages support and other AX.25 BBS functions.

I thought that there were some folks in Minnesota that wrote some PERL scripts to handle things like mail and simulate a BBS. You can easily add AX.25 to the Linux kernel and run the axl program (AX.25 listener to allow AX.25 connects to your system) and just change that program to run a script or some other Linux program or maybe a BBS program or script.

It would help on requests like this to briefly describe the rig. While
Regency is a common name in radio, I haven't seen a Regency ham rig in
operation in 10 years. Give us a clue here...

On the 1200 baud side, shouldn't be a problem. 9600 is a whole 'nother
matter. Is this an all-mode rig, or just FM? If it's FM only, then it
comes down to how cheap the design is. If the PLL is close-coupled to
the varactor curcuitry, but it back in storage. If not, it <may> be able
to be modified. I'd be happy to have a look at the curcuitry if you want
to send it to me. I would need both the IF section on receive side and
PLL and VCO curcuitry on Xmit side.

Yes, I've used them at 1200 - never tried 9600, but I don't recall their being terribly selective, so I don't see why they wouldn't work. Easy to modify, I think I still have one kicking around here.

Sounds like you've identified the problem. If plugging the mic cable into
the HTX-202 causes the transceiver to key up, then I would suspect the
mic cable. Is the HTX-202 one of those HTs that shares a line between
the PTT switch and the microphone like the earlier Yaesu HTs? I would recheck
that cable making sure you have the right kind of connector, i.e. 2 or 3
pin, no shorts, connections to proper pins, and also proper resistor/capacitor
pair if it's like the Yaesu HTs.

From: ljv92@ecs.soton.ac.uk
Message-ID: <3aikpf$dta@gauguin.ecs.soton.ac.uk>
Source record: 46293

Hi folks,

There are a few bulletins floating around the UK currently
about a program that emulates the modem that is currently
needed to run the Baycom software to run packet without
a TNC. I believe you could then just run the EMBAYCOM.EXE
program, then the BAYCOM program as normal and just trail
a lead from your rig to your PC. Packet for under 5$ / £3 !

I think it is programmed by a Russian guy - although
apparently no-one has seen this software surface for a while.
It's not appeared on any FTP sites my local archie knows about.

Does anyone have a copy / more info?

Cheers, Lee G0MTN

MiniSport Laptop Hacker (TM) - Vol #24. November 1994
To discourage pecuniary interests, Copyright (c) 1994 Brian Mork

>>> ADMIN
The MLHacker (TM) series is sized to print out on the front and back of a single 8.5"x11" sheet of paper, using 8lpi. You or your print program have to add your own page break lines or form feed character. Back issues are available from ftp.cs.buffalo.edu in the \pub\msdos\ham-radio directory, or on SimTel archives (e.g. oak.oakland.edu in the \pub\msdos\packet\mlhacker.zip file).

>>> MOBILE BATTERY POWER -- CONTINUED
Last issue, I included part one of Jim Harvey's description of how he made a suitable container for the custom battery pack. Here's the second and last part. Next issue I'll include his description of making a custom battery charger.

"Now solder the two brass contacts to the prepared PC board header. Support the PC board on a small piece of wood, copper side up. Tin the board where the contacts will lie, then place the prepared brass contacts on the board. Heat, and flow solder between the contact and board but don't let it run down the stem of the "T". Check the spacing and angle of your contacts on the battery. You can bend the brass to fit or reheat the assembly and move the contact a little. You want a firm, flat contact with the battery terminals when the header is aligned squarely on the top.

```
(Foil side) *************
|===============*******************|
(Bare side) *****
***** Battery fits
***** here
*****
```

"Solder your power cable to the two halves of the header assembly. Use red and black wire to keep track of polarity. You MUST use an in-line fuse holder close to the battery pack with about a 5 amp fuse. Terminate the loose end of the cable with your power connector of choice and the contact header assembly is finished.

"The next step is to wrap the header and the top 2 1/2 inches of the battery pack with insulating fiberglass. Inexpensive auto repair resins set up quickly, so you must have all material cut in advance.

"Prepare a piece of fiberglass to cover the top of the battery by cutting a 2" by 3" piece of cloth and unraveling about 3/8 inch on each of the four edges. This will allow the material to fold down over the sides of the battery without wrinkling. Next, cut a 2 1/2" by 6 1/2 inch rectangular piece, which will wrap around the body of the battery. Cut two small 2 1/2" by 1/2" strips. These will help form a channel around the molded battery keyway, necessary to ensure later that the cap is slipped on with the proper polarity.

"Open the Condom and starting at the contact end, unroll it down over the whole battery. This will protect the battery from the fiberglass resin. Slip the completed contact assembly into working position on the battery over the Condom, taking care not to tear the latex. Now put a bit of half inch wide masking or electrical tape over the brass contacts, carefully sealing the tape to the latex on the sides and up over the top about 1/8 of an inch. You do not want the Epoxy to bind to the contacts in the fiberglass shell, they must be free to move a bit. Be sure to observe polarity of your cable at this time, it's easy to plug the header on backwards.

"Wrap string closely around the battery about 2 1/2 inches down from the top. This will form a reinforcing ridge at the bottom edge of the completed shell. Tuck the loose ends under, or tie an inconspicuous knot.

"You are ready to begin the messy fiberglass process. Spread newspapers around everywhere, this stuff is permanent. You should wear old clothes, rubber gloves and eye protection.

"Mix about an ounce and a half of Epoxy resin per the manufacturers directions. If you have a 3 or 5 ounce Dixie cup, it's easy to guess the amount. Remember, this type of Epoxy sets up in just a few minutes so it is important to plan and to have all the pieces of cloth prepared.

"Paint a thick coat of Epoxy on top of the contact assembly and around the edges. Place the unraveled 2" x 3" glass cloth on top and paint more liquid on the cloth until it is saturated. Brush the unraveled

edges down over the sides of the battery. Now apply Epoxy all the way down to the string and position the two narrow 2 1/2" x 1/2" strips on either side of the molded keyway that runs down the side of the battery case. This helps form a matching keyway in the fiberglass shell. Saturate these strips with resin, then center the 2 1/2" x 6 1/2" cloth over the key way and wrap it around the battery. The bottom edge should cover the string and the top edge should overlap the top of the contact assembly slightly. Flow resin over all the cloth until it is saturated and smooth it out with the brush. Rotate the assembly frequently to help keep the fluid from dripping.

"In about five minutes you will feel the brush start to drag. Continue to rotate the battery slowly to prevent drips until the resin has become stiff. Set the assembly aside for 4 hours or so to set up. When it is solid to the touch, you can gently pull the cap and Condom from the battery. The Condom will separate from the fiberglass with gentle tugging. Let the shell harden a few more hours and if there is still a sticky residue on the inside, wipe it out with a rag and lacquer thinner. Cut and sand the bottom edge even at the string and sand any rough edges on the fiberglass. Dimples, bubbles or ragged edges can be touched up with 5 minute Epoxy cement.

"Paint the finished shell if you desire, and you're done. I also constructed a couple of contactless fiberglass caps to protect my spare batteries from shorting out inside my tool box.

>>> EXTERNAL CGA MONITOR -- WITH COLOR!
I found a source for Minisport external screens. As you're probably aware, the Minisport has the internal logic to drive a Color Graphics Adapter (CGA) monitor. The built-in screen, of course, is monochrome, but there's a plug on the back to hook up an external, full-color screen. Wouldn't it be great to tap into this potential at minimal cost?

Here's what I found: A 5" color monitor, *not* enclosed in any case (you'll have to put it in a metal or wood box). From the picture, you get a tube and the electronics board mounted in a minimal frame arrangement. It runs off from 12 VDC and uses a standard interface connector. They cost $69 plus $5 s/h. Advertisements show up in the magazine _Midnight Engineering_.

The small size and mandatory custom enclosure could make for some interesting portable setups for use with the Minisport! They're available through Timeline Inc., 23605 Telo Ave,, Torrance, CA 90505. Technical info line is 310-784-5488. Orders only line is 800-223-9977. I have not purchased one of these, and I've not dealt with the retailer. I'm bringing it up here only to make known the availability of such a beasty. If you purchase one and use it with the Minisport, let me know!

mattb@dgs.dgsys.com (Matt Brosius) writes:

> I'm looking for information from anybody who has used packet on 80 meters
> or other hf band. Has it worked with reliability.

I've used AX.25 packet radio on HF extensively (for ham and non-ham communications), particularly in its early days.

AX.25 300 Bd 200Hz/FSK packet radio is uniquely unsuited for use on HF. One couldn't design a more inappropriate protocol and modulation scheme if they tried! Given the fact that there are some pretty good schemes available now at the same price, it's time the digital community exercised good spectrum stewardship and good operating practice and started to wind down AX.25 packet on HF. Given the alternatives, e.g., the TOR's, AX.25 on HF makes about as much sense as AM on voice.

But to answer your question, more or less, AX.25 packet (like other digital modes) works better with increasing frequency. The rule of thumb is to operate as close to the MUF as practical, e.g., to minimize intersymbol interference. Bottom line is that AX.25 packet is not very good and AX.25 on 80M is worse!

NEWS NEWS ..... NEWS NEWS
NEWS NEWS NEWS NEWS NEWS NEWS NEWS NEWS NEWS NEWS NEWS
----------------- TRANSMITTED BY ZL1AMW --------------
-------------------- H A M I L T O N -----------------
13 Nov 1994

This is a weekly unofficial bulletin of news and views from ZL
amateurs. It does not represent any official viewpoint, and all
opinions are those of the contributor.

Change to 40 metres
------------------- From ZL1AMW
The overwhelming opinion from my request last week was for a
change to 40 metres, so I now give notice of a change. From the
evening of Wednesday 16th November the ZL1AMW selcal will shift to
7045KHz (mark note, tune to 7047.125 LSB for most types of modems).
The newsletter next week will transmitted on 7045KHz also.

PacketPet for Windows
---------------------- From RadCom Magazine.
The September issue of RadCom (RSGB magazine) has a review of a
new piece of software released by PacComm called PacketPet for
Windows.
The review is very complementary, the programme includes all the
features expected of windows, with the ability to run multiple
sessions, (each warning of a connect while minimised). You have
the usual colour and layout controls, split screens under mouse
control, lots of screen buttons, an integrated text editor and an
internal macro language.
The programme can be linked with standard .WAV files to announce
connections to you out your sound card... what more can you wish
for?
I have not seen this product advertised here in ZL,but a letter

to your usual PacComm supplier may be worthwhile. The RadComm review copy came from Siskin Electronocs in the UK.
- inserted by ZL1AMW

More Windows Packet
------------------- From ZL1AMW
A bulletin by Bill, ZL4TCO details another programme called PKTWIN by G4YFE, which seems to offer many of the same features. Bill os offering copies of this shareware programme, drop him a note at ZL4AA BBS, or by post to his callbook address.

Selcal off-air!
-------------- From ZL1AMW
I came out to my shack on Friday evening after a hard week, to experience the shock of seeing my Selcal transceiver sitting there dead and cold....
The trusty TS440 gets a bit of a hammering with the RTTY usage, so I am often dread this happening.... and I started checking things out.
First - the radio was cold, with no dial lights at all, so - check the power supply. The supply looked OK, so I got out the trusty multimeter, and pulled the plug on the TS440 to check supply there. It was all OK, so horrors, the problem must be inside the radio!
I moved the radio to the bench and took off the bottom cover - looking for any damage or something similar, and found nothing, so I checked the power on the back of the connector, and - no volts! Pull the plug out and there is volts on the pins, but when in the rig (whether the radio is on or off) and there is no voltage.
To cut a long tale a bit shorter, I tracked it to a high resistance fuse, the in-line glass cartridge holder supplied by Kenwood in their power lead. It looks as if this fuse has been running a bit hot, and the internal wire (well, a bit of metal strip in this case) had curved and loosened itself from the solder. A touch with a soldering iron at both ends, and all is well again. While I am frustrated that the station can be put off-air that easily, it was certainly the lowest cost-repair that could have been imagined.

That concludes the Data News for this week, this sheet is prepared at the shack of ZL1AMW from contributions sent by post, RTTY and packet. Text is also obtained from packet BBS stations, and Selcals on 7045/3545khz.
This news is transmitted weekly on Sunday mornings at 0930hrs (local) and repeated at 1900hrs. Both transmissions are on 3545khz. It is first sent in Baudot at 75 baud, then repeated in AMTOR mode B (FEC) on both occasions.
73 to all from Alan, ZL1AMW, 20 Lorne St., Hamilton.

SPECIAL MESSAGE FROM ZL1UWV@PINN.NACJACK.GEN.NZ (Carl Trommel)
==========

I am leaving New Zealand in three weeks. (Moving to the Gold Coast - Australia)
I will be no longer be able to POST the ZL DATA NEW to Internet.
I'm looking for a volinteer to take over this horrible (Just joking) job.
Can YOU help??? My C64 will soon be packed away...so please reply promptly THANK YOU!!

...Carl

>> well).. Several old Midlands have been placed in service at 9600 but they are
>> hard to find.. I know one guy who modified a Mitrek..
>>
>> Can any of you give some suggestions? I am leaning toward the Hamtronics but
>> I would like to hear some advise..

We have been using IC-38s with very good success in Toronto.. Also in Buffalo
they have been using the TM-331 as well.. They have been both integrated with
the Tiny 2 and NB-9600 modems..

Cheers

CN> why the heck are TNC's so bloody expencive? and a kit a saw
CN> was only 60$... i don't get it, what MAJOR advantage does an
CN> ordinary TNC have over a kit tnc?
CN>
CN> thanks....

Well the reason that a baycom modem and a AEA tnc are differnet in price
is that a AEA TNC has a mini computer in it, and a baycom doesn't. That's
why you have to run all of the drivers to get it to work, that's becuase you
your PC is the computer for the Baycom, while a REAL TNC you can have your PC
turned off and it's STILL keeping track of your mail. Mini Computer.

Heh, heh! It's a CRYSTAL radio! Remember those? It is solid state,
though, uses (I think) a discriminator and a varactor, so it shouldn't be
too bad.

4261. TAPR on Internet - Periodic Announcement

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-19 18:41:05 UTC
From: gjones@tcet.unt.edu
Message-ID: <3algs1$eho@hermes.unt.edu>
Source record: 46317

Periodic Announcement - TAPR Information and Internet Access

Greetings from TAPR!

TAPR can be reached via the Internet. The Automated Information Server that TAPR provides allows anyone to request information on TAPR, products, newsletters, and lots of other files. To find out more about this service, send an e-mail message to listserv@tapr.org with the subject line "Request" and the following text in the body of the message:

help (for a brief set of instructions)
index -all (for a list of all file by topic area)
get tapr taprinfo.txt (or info on TAPR)

In the above message example, "help" retrieves a brief set of instructions for info, "index -all" retrieves a list of available files by topic and "taprinfo.txt" retrieves a text file containing information on TAPR and what TAPR is all about. If you want to retrieve several text files with one message, use a separate line for each "get filename" request.

General Information:

* Ever heard of a TNC ?

* Interested in general packet radio information?

* Interested in high-speed packet operations?

* Interested in other types of digital communications?

* Interested in experimenting or building kits?

* Interested in keeping up-to-date on national digital and packet issues?

Then you might be interested in TAPR!

Goals:

% Support Research and Development efforts in the area of amateur digital communications

% Disseminate information on packet and digital communications

% Provide affordable and useful kits for experimenters and hobbyists

% Pursue and help advance the amateur art of communications through publications, meetings, and standards

History:

If you have used a packet radio TNC, then you are already a part of TAPR history.

The TNC (Terminal Node Controller) project grew from a discussion in October of 1981 at a meeting of the Tucson Chapter of the IEEE Computer Society. A week later, six of the attendees gathered and discussed the feasibility of developing a Terminal Node Controller that would be complete and available to amateurs at a modest cost. This was the genesis of TAPR.

On June 26th 1982, Lyle Johnson, WA7GXD, and Den Connors, KD2S, initiated a packet contact with the first TAPR unit. The project progressed from these first prototype units to the TNC-1 and then finally to the TNC-2 which is now the basis for most amateur packet operations worldwide.

TAPR was founded in 1982 as a national organization with interests in the areas of packet and digital communications. Today, TAPR continues as a membership supported non-profit amateur research and development organization. TAPR currently has more than 2000 members, worldwide. TAPR continues to develop kits for the amateur community and is working actively on publications and communications standards.

Membership:

Membership in TAPR includes a subscription to the quarterly published Packet Status Register newsletter. PSR has been published since 1982 and is recognized as an authoritative source for up-to-date user and technical information on packet radio. Much of the material in PSR is timeless. Back issues may be obtained from the TAPR office. Membership in TAPR is $15 for one year. In Canada and Mexico membership is $18 and outside North America they are $25.

Join the amateur digital-revolution -- Join TAPR!

Special Interest Groups

TAPR maintains several SIGs in various areas. To get the latest list of SIG groups, send an e-mail message to listserv@tapr.org with the subject line "Request" and the following text in the body of the message:

lists (for list of mail groups on TAPR.ORG)

To request the information on any mail group, send an e-mail message to listserv@tapr.org and in the message text include:

information listname (where listname is the name of the mail group)

When you are ready to subscribe, send e-mail to listserv@tapr.org with the following command in the message text:

subscribe <list> <your name>

List should be the name of the mail list you want to join and Your Name
should be both your First and Last Name.

Current SIGs include:
NETSIG Regional Networking SIG
BBSSIG BBS SIG
HFSIG SIG on HF Digital Topics
DSP DSP Software Development Forum
DSP-93 SIG for those that are building TAPR/AMSAT DSP-93 kits

---

FTP users

The TAPR Software Library is now available via anonymous FTP. You can
access the library by ftp access to 'ftp.hereford.ampr.org' in the directory
pub/hamradio/tapr. Login in as 'anonymous', with a password of
'your_account@internet_address'.

Packet Raido and TAPR is on the World-Wide-Web!

The series is accesible through the Packet Radio Home Page at this
URL:
http://bb.iu.net/infomotion/taprhome.html

http://bb.iu.net/infomotion/pkthome.html

What's here? A page of links (the Home Page), the TAPR Home Page, a page of
Packet Pioneers and Contacts, a hypertext packet primer and FAQ, and more.

Thanks to Howie, N2WX, President of Infomotion, for his support and invaluable
contributions of the TAPR page.

There's an IEEE reprint volume on multiple-access communications. It was
recently published (1993) and includes the above-mentioned article.
It also includes much foundational work by Kleinrock and others (including
the developers of the Aloha packet radio network at the University of
Hawaii in the early 70's).

Here's the bibliographic information:

Title: Multiple access communications: foundations for emerging
technologies / edited by Norm Abramson.
Publisher: Piscataway, NJ : IEEE Press; New York : Institute of
Electrical and Electronics Engineers, c1993.
Alt Authors: Norm Abramson, IEEE Information Theory Society

Source record: 46320

I want to set up a digital link to our Internet connection at my college and need someone who is willing to recommend equipment and access methods. I want to permit packet radio access to our network and would like it to be a first class installation. I have the budget to do the job and do have some knowledge but not enough. We are a state school in a rural area and recommendations coming from my local contacts don't seem to be what we need. If you have done it right or know how to do it right you can easily influence me before the vendors do.

If you are willing to send me a list including equipment, licenses, books, services, etc., I would really appreciate it. If you are willing to establish a dialog via email I'd like that even more.

In article <1994Nov16.160030.23290@ke4zv.atl.ga.us>,
gary@ke4zv.atl.ga.us (Gary Coffman) wrote:

>This leaves the computer free to be either a terminal emulator (a waste),

Which is what most hams are doing... So why not have the computer do what
the TNC does and save a few bucks on the TNC and just buy the modem...???

Don't flame me, I have both... Two Baycoms and a PCB-88...
And I've had just about every kind of VHF packet TNC there has been...

It's fun to have both in different situations... When I'm traveling with
my laptop I use the PacComm Baycom modem because I don't have to have a
separate power supply for the PacComm unit and it's easier to use in the
car... And the Baycom software is better than most terminal programs...
Having the ability to watch what is going on in the monitor window while
being connected is very desireable... You can only do this easily when the
decoding software is part of the computer... Also, Baycom and an old
program, THS, which worked with WA8DED emulation would let you easily be
connected to more than one person at a time... The stream switch thing in
most TNC's has never been properly handled in packet software... At least
I never found anything... And I never was able to connect to anyone who
was connected to someone else... But with Baycom, I have been connected to
three people and a BBS all at one time...

So don't knock the Baycom... It's hard to get the configuration file set
up properly, but a little effort there makes the program worthwhile... I
think that what most people are upset about is the cost of the Baycom
versus a TNC... There isn't much to the Baycom and it's probably a little
overpriced... But for $50-$60 it still offers a good way to get on packet
and some people never leave it... I just sold two TNCs at the local
hamfest and I would have sold this PCB-88, but I'd of had to take the
computer top off and unplug it...

As full service BBS's take care of your mail there isn't much need for
personal mailboxes so Baycom is the more desireable... Of course if you
want a node or a digipeater or a mailbox, then the TNC is the way to go...

4268. Packet and HP-95

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-19 23:59:34 UTC
From: fk192@cleveland.Freenet.Edu
Message-ID: <3am3h6$r9l@usenet.INS.CWRU.Edu>
Source record: 46305

A friend asked me to post the following question. Has anyone used a HP-95 and a tnc for packet? What packet program did you use and what tnc. My friend has a HP-95 and would like to hook it up to packet. Any ideas as to what software to use. He has access to a Kam, KPC-4 or PK232 for the tnc and the radio is no problem.

There are other bands, like 418 MHz (I think it is a world wide allocation) for which you can obtain tx/rx modules that accept/produce digital data. They are only 1200 baud (ish) and are limited to 0.1mW but have an outdoor range of up to 300 yards. Better if you use a colinear. The RXs aren't wonderful, but they are small. They are designed for garage door openers, alarms etc. so you might have to watch what you do with them (I think they use a slower code anyway).

Very simple actually. Mail comes in via a uucp connection to Waffle
1.65. Customized software reads the information, and converts it to a
smtp formatted message for my JNOS 1.10g to forward out the ax25
network.

Software is fully automated, except I have to manually run the batch
files since this is my only way of screening all the mail to make sure
they comply with FCC regulations.

>: mostly on the 9k6 channels.

Hello,
I have had similar problems to yourself but with ordinary serial cards.
I would guess you are trying to use a DOS version of NET. IBM suggest
you don't run DOS applications with serial io above 4800 bit/s. This is
because OS2 has to mimmic the DOS driver and it is very time consuming.
The only real solution is to use an OS2 version if one exsists, then you
will be able to use it at at least 56K.

>>> ADMIN
Any votes for an index issue yet? Compendiums of all issues are available from ftp.cs.buffalo.edu as \pub\ham-radio\mlhackXX.zip, or on SimTel archives (eg. oak.oakland.edu) as \SimTel\msdos\packet\mlhackXX.zip. The XX in the filename indicates the last issue number, and replaces the previous convention of using mlhacker.zip for all compendiums.

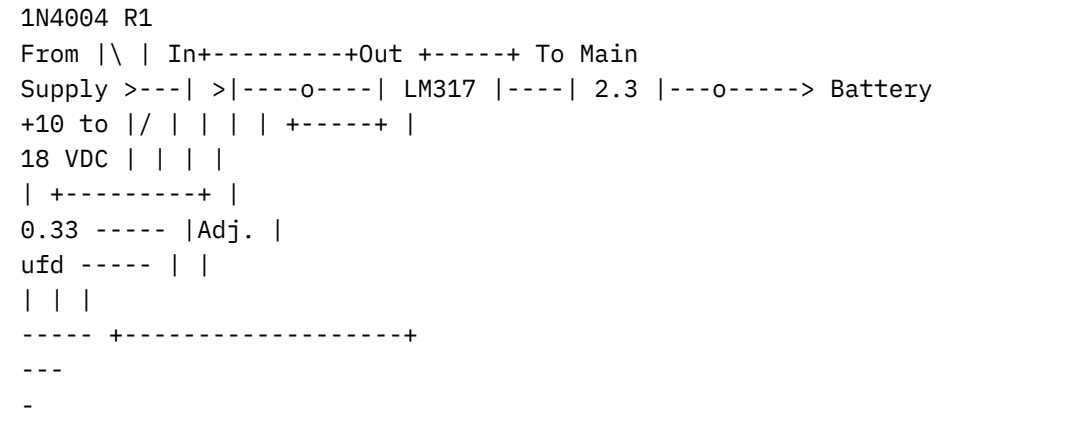
>>> CUSTOM BATTERY CHARGER.
Last issue, I concluded Jim Harvey's description of how he made a custom battery pack using a power drill battery. Now he's built a dedicated charger unit and found a replacement for the expensive Li batteries. What a job, Jim! Others, read on!

"My ZL-2's heritage is Garage Sale. It came with neither battery or charger. I was able to obtain batteries for a reasonable price but Surplus Communications in St. Joseph wanted $70 for a Zenith charger, too much for a Garage Sale computer. For a year I have been unscientifically trickle charging the batteries with a CB radio power pack connected through a 47 ohm resistor.

"I found several state of the art NiCad charger circuits in QST and other magazines. Most depended on a tiny droop in battery voltage near the end of the charge cycle. I wanted to leave the battery in the computer, though, and the 600 milliamp current surge when turning on the machine would surely confuse the chip. One of the references I checked showed simple constant current charge circuits based on the LM317 adjustable voltage regulator(1). The schematic could not be simpler. Two parts! Figure 1 has added a recommended protection diode and a bypass capacitor to bring the parts count up to four.

The way this circuit works is: The LM317 will do it's level best to keep the voltage difference between its output and adjust terminals at exactly 1.25 volts. This will be the voltage dropped across R1 by a current of 1.25/R1 amps. The 2.3 ohm value was obtained by paralleling two 4.7 ohm half watt resistors (at least one watt is needed). This gives a regulated current of about 530 ma, sufficient to operate the Minisport with a little left over to charge the battery.

Fig. 1 Basic Constant Current Regulator I = 1.25/R1 = 530 ma.

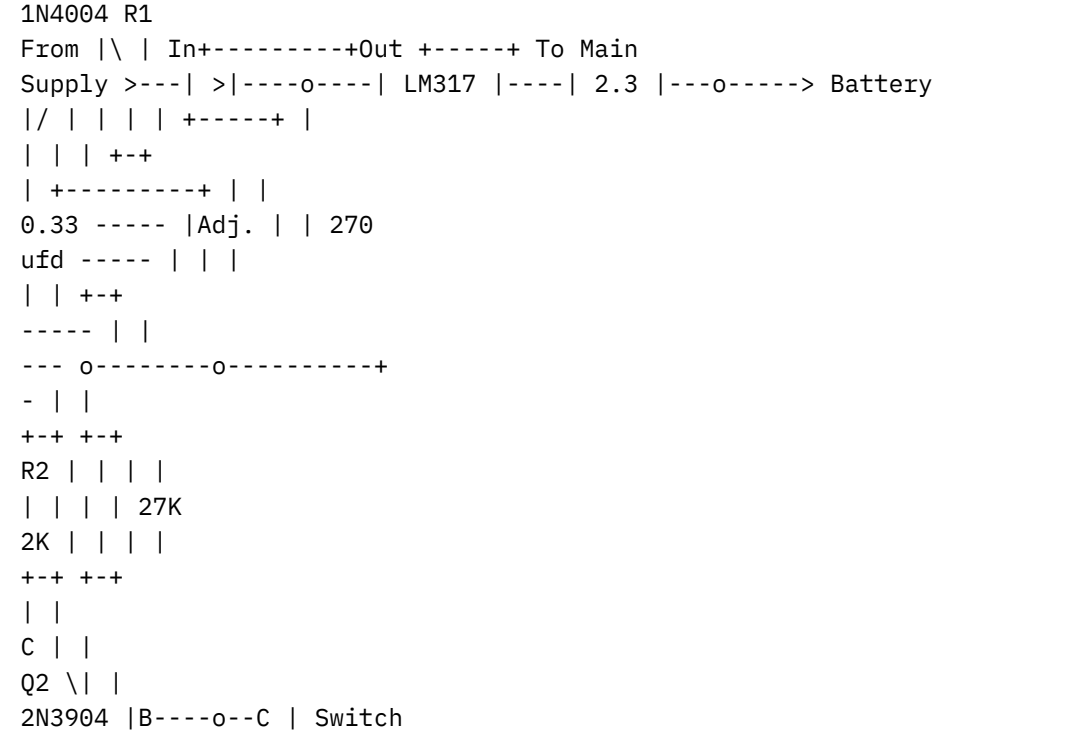


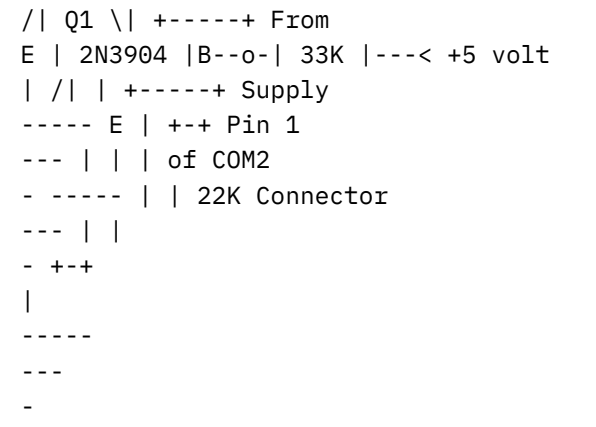
What was really needed was a circuit that would pass enough current to run the computer when it was operating, but would cut back to a traditional 0.1C charge rate when the machine was off. I added the two transistor circuit shown below in figure 2.

The switch lead is connected to the Minisport's internal 5 volt power supply; I obtained this from pin 1 of the internal modem connector (see MLH #8). When the computer is off, this is at a few tenths of a volt above ground. Q1 is cut off, which allows Q2 to conduct. Current flow through the 270 ohm resistor increases the voltage seen by the LM317 adjust terminal and the regulator decreases the current. The 2000 ohm value of R2 allows an output of about 160 milliamps.

When the Minisport powers up, the 5 volts supplied to the switch sense lead causes Q1 to conduct which in turn cuts off Q2. The LM317 then operates as in Figure 1.

Fig. 2 Modified Current Regulator With Trickle Charge Switch





"I assembled the components on a piece of perf board which slides into the internal modem slot of the Minisport. It's wired directly into the main battery terminals at the motherboard. The LM317, for heat sink purposes, is bolted to the metal bottom plate with a mica insulating washer underneath and a nylon screw (the tab of the LM317 is connected to the output terminal.) I epoxied a 2.5 millimeter barrel type power socket into the phone jack hole of the modem slot cover to connect the external DC charger supply (a 14 volt 2 amp switcher, another Garage Sale acquisition). The charger could just as easily be built in an external box. You would need a 3 wire connector to bring out the 5 volt switch sense lead though.

"The LM317 current limited charger will happily run the computer from an auto cigarette lighter socket. You should put an inductor in series with the lead and use an MOV surge suppressor to protect the machine from the relatively dirty auto voltage as discussed in MLH #12 and #21.

"Another improvement made while I had the Minisport disassembled was to discard the expensive coin cell backup batteries and functionally replace them with a set of small NiCads tucked in the modem compartment. There are several cordless phone batteries that can be fitted into the space. You need five NiCad cells for the necessary 6 volts, use thin wire wrap wire to carry the current over to the terminals on the edge of the motherboard adjacent to the coin cell compartment. To keep the new backup battery topped off I connected the positive side to the new charger input jack through a 1000 ohm resistor. This will allow somewhat less than 10 milliamps to trickle in which is reasonable considering the limited duty cycle of the backup system. It is only in use while the main battery is being changed or is completely discharged.

"(1) Engineer's Notebook - Integrated Circuit Applications, 1980 Edition, Forest H. Mims, (C) Radio Shack. [BjM: I use a similar, simple circuit to drive my laser diode experiments. It works well.]

[more stuff deleted]

Sound cards using the Analog Devices DSP-based PSA chip set such as the
Cardinal PRO16, Orchid SW32, etc. are already being used for this type
of application. For instance, software for PACTOR is available, and a
CW filter.

I don't know of any. I think ham operator with half a brain would have
serious reservations about giving the general public access to his TNC.

I hear, though, that there exists a packet wormhole from the US to
Europe that uses the Internet. I trying to find out more about it; no
details available at the moment. Anyone else heard of such a thing?

The built in terminal program will work, just remember to set the TNC for software flow control since the HP95 doesn't support hardware flow control. Any other communications program for the HP95 should work as well, and most DOS communications programs that don't make assumptions about the screen will work too. Windows programs are right out, of course. Jay Maynard even ported a version of the TCP/IP NET program to the HP95.

>three people and a BBS all at one time...

Ok, for realtime keyboarding, the Baycom system is often fine. What I
was trying to intimate above is that realtime keyboarding isn't what
packet does best. For non-realtime services, substantial programs
need to be running in either your computer, or in a TNC. Also, TNCs
generally have better modems, and in the case of other than terrestrial
300/1200 baud FSK, the only modems (I know about the 9600 baud modem
for Baycom, but it costs nearly as much as a 9600 baud TNC). So if you
want to do satellite packet, or higher speed terrestrial packet, the
Baycom system can't help. On HF, of course, one of the TORs and a good
soft decision filter based modem will be better.

Letting the computer do the PAD functions isn't really a bad idea,
however, but at speeds above the lowest, a hardware HDLC assist
is very welcome. It doesn't have to be a complete TNC, but it needs
to be more than what is offered by the Baycom hardware.

No joke. The problem is the reverse, trying to keep their emissions in
the amateur band, and trying to keep everything but the desired signal
out of their broad as a barn receivers. The HR-2 wasn't even a very
good radio in it's day, and it's day is long past. Still, it beats
throwing rocks with a note tied to them. :-)

>
><note: even tho i have no tnc...i am on landline packet bbs>
>
>DAvid

The reason why that kit is cheap is because it is NOT a TNC. It is a packet modem, which is simply a tone detector and generator for 1200 baud packet. A real TNC has an internal computer to handle all of the packet processing, communications parameters, user interface, etc. while the modem you have seen relies on your PC for the brains. The latter is cheaper, and for personal use is more convenient if you have a compatible computer. But with a regular TNC, you can use any computer with a serial port & a comm package or even just a dumb terminal to do packet. I have one of each type, and I like them both for certain situations. If I just need to connect to a BBS or have a packet QSO, I prefer my Baycom (that's the most popular packet modem) clone kit over my Kantronics KPC-3 for convenience. The Baycom is smaller and has less cables to worry about. On the other hand, if I need to set up a digipeater for field day, or need a way for people to leave me packet E-mail when my PC is off, my KPC-3 will do all of this without the aid of my PC, or any other hardware besides my radio. Each one of these has their own advantages over the other. If you are just starting out, get a Tigertronics BayPac modem. It is essentially the same as that kit you saw, but it's only the size of a DB-25 connector, so it doesn't take up any extra space behind your PC, and it comes with good documentation and the software necessary to make it tick.

Have fun with packet, whichever method you use...

: they exist but I am not willing to spend mega-bucks on it.

There is a shareware program called hamcom. You can build the interface
for a few bucks with parts from radio shack. Works ok for morse,
although not much can work really well unless it is sent by machine or
a very good operator. It works very well for baudot/ascii rtty, but
note that many transmissions are neither.

IMHO it is a good intro into rtty.

Geoff.

From: flaherty@pa.dec.com
Message-ID: <flaherty.785383893@bora-bora.pa.dec.com>
Source record: 46329

One possible explaination:

Small phase PSK tends to produce a spectrum with a peak at the center, a fast rolloff, a large gap...and then another set of significant sidebands. So, it's possible that this individual looked at the fundamental, saw the fast rolloff, and then got very excited, not bothering to look out a bit further.

So, evil intent isn't a necessity here, just gross carelessness.

There are lots of them although most will require a login name and password
unless you are originating from an ampr.org site.
Check your local nodes for sites with IPxxx as an alias. These are generally
IP stations and will be able to point you in the right direction.

FLUCTUATIES IN OZONLAAG. De dikte van de Ozonlaag, die het leven op
----------------------- Aarde beschermt tegen schadelijke ultra-
```

violet (UV)-straling, varieert van nature. Bij natuurlijke processen wordt Ozon gevormd uit zuurstof en ook weer afgebroken. Hierbij is echter sprake van een zeker evenwicht. De processen,die voor aanmaak en afbraak van Ozon zorgen, worden beinvloed door de wisselende hoeveelheid energie, die de Zon aan de aardatmosfeer toevoegt. De mens is echter, vooral sinds de industriele revolutie, deze natuurlijke ozoncyclus gaan verstoren. Chloorhoudende stoffen (zoals CFK's, ofwel Chloorfluorkoolwaterstoffen) spelen een belangrijke rol in de vernietiging van Ozon. Om de invloed van de mens op de ozoncyclus te kunnen meten, moet echter bekend zijn, hoe groot de natuurlijke fluctuaties in de ozonlaagdikte zijn. Dit is een van de taken van ATLAS-3: de reeks vluchten in dit project moet variaties in de hoeveelheid door de Zon uitgestraalde energie aantonen. Dit is ook de reden, waarom de ATLAS-vluchten verspreid zijn over een elfjarige periode, in die tijd doorloopt de Zon een cyclus, waarin de hoeveelheid uitgestraalde energie varieert. Metingen gedurende die periode zullen hopelijk een zekere regelmaat aan het licht brengen in deze energiehoeveelheid. Afwijkingen van dit patroon kunnen dan een belangrijke reden zijn voor een betere aanpak van het ozonprobleem.

SATELLIETEN GOES. Vanaf 1977 staan er geostationaire satelieten
---------- boven de evenaar, vlak ten Oosten en Westen van Zuid Amerika boven de equator (evenaar). Vanuit die posities kan de bewolking boven de USA en omringende zeegebieden worden bekeken. Zowel dagelijks bij zichtbaar licht als 'snachts met infrarood, worden er minimaal elk half uur opnamen gamaakt waarop het ontwikkelen, verschuiven, oplossen en groeien van wolkendekens (partijen) kunnen worden gevolgd. Deze groep van waarnemende satellieten zijn genaamd GOES en de betekenis daarvan is .: Geostationairy Operational Environmental Satellite.

NOAA. In het systeem van USA polaire satellieten zijn vanaf 1970 de
----- ESSA satelieten opgevolgd door satellieten met de aanduiding NOAA. Deze satelliet typen zijn vanaf de jaren zeventig gelanceerd. Zowel in de opname techniek als ook zijn vorm, verschilt totaal bij de NOAA ten opzichte van zijn voorgangers. De satelliet is kubusvormig met zijden van 101 CM en daaraan gemonteerd drie wieken die bestukt zijn met zonnecellen welke de zonne energie omzet in elektrische energie. Voor het maken van wolkendeken opnames worden in deze satelietten een geheel nieuwe opnametechniek gebruikt.
Het aardoppervlak wordt, middels ronddraiende spiegels, afgetast in stroken met een bepaalde breedte, waarbij de voortbeweging van de satelliet in zijn baanvlak zorg draagt voor de verplaatsing ten opzichte van de elkaar aansluitende stroken. De opnamen van deze stroken vormen de beeldlijnen die geleidelijk worden opgebouwd. De stroken worden zowel infrarood als bij,met zichtbaar licht opgenomen waardoor gelijktijdig twee opnamen worden gemaakt. De licht opnamen

vervallen uiteraard gedurende de nacht. De signalen die bij de af-
tasting verkregen worden zijn wisselend van intensiteit naar gelang
de wisseling in temperatuur of helderheid boven de afgetaste strook.
Deze wisselingen worden voornamelijk veroorzaakt door de aanwezig-
heid van wolkendekens en wordt direkt overgeseind. In de opvang-
stations worden zij omgezet naar beeldlijnen, die samen een opname
leveren van on- en zichtbaar licht. Van horizon tot horizon bedraagt
de lengte van de strook ongeveer 6000KM waardoor naar de Horizontale
zijden een vertekening ontstaat vanwege de kromming van het aard-
oppervlak ten gevolge van het perspektief of uitzicht. Hiervoor werd
door de Technische Hogeschool in Delft een techniek ontwikkeld die
dit kon korrigeren. De satelliet was dus niet meer voorzien van
televisie camera's.
..... wordt vervolgd. bron .: PA3BKW.

DUITSLAND. De meteorologische dienst van het Amt fur Wehrgeophysik
---------- in Traben-Trarbach bij Keulen, zendt sinds enige tijd
alleen radioteletype weerrapporten uit tijdens militaire oefeningen.
Tot nu toe was het station continu met weerbulletins in de lucht. De
zenders voor deze dienst staan in de plaats Grengel.Er wordt gewerkt
op de volgende frequenties.: 2017.5, 2690.5, 2822.0, 3035.0, 3231.0,
3279.0, 3825.5, 4785.5, 4903.0, 5296.0, 9318.0 en 11125.0 kHz. De
transmissiesnelheid is 100 baud. (Bron: Utility Newletter)

KROATIE. Radio Zagreb kan om ongeveer 09.03 uur UTC met een kort
-------- Engelstalig nieuwsbulletin worden gehoord op de nieuwe
frequentie 7370 kHz. De parallelfrequentie op dit tijdstip is 9830
kHz. De aangekondigde frequentie van 13640 kHz lijkt opzettelijk te
worden gestoord. Het zou uiteraard geen verbazing wekken als de
betreffende stoorzender op Servisch grondgebied blijkt te staan. In
dat geval is het voor het eerst sinds de voormalige oostblokstaten
het communisme afzworen, dat een Oosteuropees land zich schuldig
maakt aan 'jamming'.

NIGERIA. De Voice of Nigeria kan om 18.00 uur UTC met het bekende
-------- interval (drum)signaal worden gehoord op 7255 kHz. Tot
18.00 uur UTC zendt de Nigeriaanse wereldomroep uit in het Arabisch,
daarna in het Frans. De ontvangstkwaliteit is doorgaans zo slecht,
dat de programma's niet of nauwelijks kunnen worden gevolgd.

UZBEKISTAN. Het tweede programma van Uzbek Radio uit Tashkent is in
----------- de ochtenduren met een sterk signaal te horen op 15165
kHz.

ZUIDOOST AZIE. De BBC World Service zendt van maandag tot en met
-------------- vrijdag tweemaal per dag een speciaal Engelstalig
nieuwsbulletin op dicteersnelheid uit. Deze programma's zijn gericht
op het verre oosten en komen in de ether vanaf zenderparken in Hong-
kong, Japan, Singapore en Zuid-Korea. De eerste uitzending vindt
plaats tussen 09.45 en 10.00 uur UTC op 6065 kHz (Yamata, Japan),

7180 en 9580 kHz (Hongkong), 11955 en 15360 kHz (Kranji, Singapore).
De tweede uitzending gaat tussen 14.45 en 15.00 uur UTC de lucht in
op 5990 en 7180 kHz (Hongkong), 7290 kHz (Kimjae, Zuid-Korea) en
9740 kHz (Kranji, Singapore). Omdat de antennerichting voor ons zeer
ongunstig is, mogen de betreffende signalen als DX-vangsten worden
beschouwd. (Bron: BBC World Service, Jan Nieuwenhuis)

4293. 16-QAM at RF...

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-21 07:50:04 UTC
From: matt@plab.dmll.cornell.edu
Message-ID: <3apjfc$ko9@newsstand.cit.cornell.edu>
Source record: 46332

Anybody here ever tried to implement QAM on a VHF channel? I'm thinking specifically about V.32, but any tips are appreciated.

I'm thinking of using a DSP-based soundcard to do the bulk of the mod. and demod., but I'm kinda stumped as to how to progress with the radio. One way would to put it on a baseband carrier like 10kHz, then move that to 6m, for instance, via a transverter of sorts. But that seems more complicated than it's worth.

The other obvious way would be to do the final stage of modulation in the radio. The transmitter would look something like:

```
m1 >---------(X)----v
sin(w)--^ | (X) = a mixer
(E)---> out (E) = a summer
cos(w)--v |
m2 >---------(X)----^ m1,m2 out from trellis coder
```

This seems quite easy, with the possible exception of the pi/2 phase shift of the carrier freq. to get cos(w). One possibility that's occured to me would be an appropriate all-pass filter, but I know nothing about building these at 50MHz.

So, does anybody know of a nice, crystal-controlled circuit that will generate a 6m carrier in quadrature? Likewise, any insight into a (simple) implementation for the receiver would be appreciated.

4294. AFSK tone for 2400baud Packet ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-21 09:08:55 UTC
From: victor@ibpm.serpukhov.su
Message-ID: <victor.34.0@ibpm.serpukhov.su>
Source record: 46249

Hello ALL

I read about NEW 2400bps radio modem from MFJ and other.
What's tone standard for Amateur Packet on 2400 ?

I believe that they use some higher AFSK tone than on 1200bps.
I heard about 3658/1996 Hz. Is't true ? Or maybe there no any
standard yet...

I'am try play with TCM3105 on 2400 (it work if S/N is good) and will
set up true tone.

Tnx in advance, 73! de RX3DIN Victor

4298. 8530 SCC programmers ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-21 12:23:02 UTC
From: adsb@bnr.co.uk
Message-ID: <3aq3f6lNNff4@bhars12c.bnr.co.uk>
Source record: 46240
Cross-posted to: rec.radio.amateur.digital.misc,uk.radio.amateur

Does anyone have any experience of programming the Zilog/AMD 8530
SCC chip to operate on a radio channel in open-squelch ?

I know it can be done, because my Pac-Comm TNC-220 does it, and
the G8BPQ Packet Switch does as well.

Running TCP/IP with JNOS, the standard SCC.C code checks the SCC port's
DCD line, which is wired to the modem chip on most SCC cards - and so
the DCD is always true when operating in open-squelch mode.

I've modified SCC.C to look at the SYNC/HUNT bit instead, and that tells
me when the SCC port is hunting for an opening flag - and thus not currently
receiving a signal.
This modified code works reasonably well, but by no means as well as the
open-squelch operation of the G8BPQ Packet Switch.

I'd be keen to hear if anyone has a better way of doing =software= DCD.
Yes, I could buy Open-Squelch boards for a hardware solution, but I
specifically want to try a =software= solution - and I know it can be done
successfully... at least by G8BPQ.

Hi Kurt, see the latest issue of QEX where the TTY function is done
with a sound card. Morse is even easier.

4303. 49MHz for digital

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-21 17:00:53 UTC
From: mack@mails.imed.COM
Message-ID: <9410217854.AA785448654@mails.imed.com>
Source record: 46246

Steve Jackson asked about using 49MHz part 15 radios for a neighborhood watch setup.

Steve I know of nothing in part 15 prohibiting data useage of these radios. The only problem is that you are not allowed to modify the transmitters IN ANY WAY. This includes using something other than the supplied antenna. However, you could use 2 radios: one for transmit mounted in the attic or on the roof and another with a good antenna on the roof and the receiver near the computer. It might also be possible to use the receiver with a good antenna on the roof to communicate with the transmitter inside the house. It's worth buying 2 to 4 of these to run a set of tests.

Just keep in mind you cannot legally modify the transmitters in any way.

it's crystal controlled (i think a big 12 channels in the A model), wide front end (a bad thing today) and i don't remember the transmitter in any great detail...certainly a lot of HR-2's are in use on packet for 1200 baud after they get moved down to cover 144-146 MHz (default was 146-148, if i remember correctly).

: So, does anybody know of a nice, crystal-controlled circuit that will
: generate a 6m carrier in quadrature? Likewise, any insight into a
: (simple) implementation for the receiver would be appreciated.
: 73 de kb8uox . "Wisdom is ignorance...

The easiest way, IMO, to build a quadrature modulator for 6M would be to use an RF Micro Devices RF2802 - that part takes a low level LO signal in the 20-250 mHz range, phase splits it, and mixes/combines the I/Q data, all in one part. Image/carrier suppression is typically 40 dB or better. They make demodulator parts too.

BTW, in the "read before you try" department you might chase down some of the papers produced by Sampie's research group at Osaka U in Japan. One article they published recently is in IEEE Transactions on Vehicular Technology, Aug '93, pg 528: titled "Performance of a Trellis-Coded 16QAM/TDMA System for Land Mobile Communications".

4314. Kenwood 732.dead.2mtrs

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-22 07:40:07 UTC
From: droy@netcom.com
Message-ID: <droyCznryv.5As@netcom.com>
Source record: 46257

Hello,
Has anyone here had problems with the Kenwood 732. I sent the radio back because the power output on the 2mtr side died. They had the radio for 2 days and sent it back after having, quote "Repaired APC circuits. Resoldered all joints and do corrective/preventive repairs on TRX unit and APC 023 protect mod. Full function test rx/tx GOOD. 2 mtrs po 50/12/5 Stable." unquote.

This seems to translate to "could not find the intermittent problem."

The radio worked for 3 days and now does not put out any power on the 2mtr side. It is back in the brown truck to Long Beach.
Have you had similar problems? Please let me know, I would like to suggest to the kenwood folks a plan of attack to fix this problem.

Please reply here or e-mail me. I may post your replys minus your name if you have a similar story to save the next ham radio brother (sister) a few UPS charges.

Thanks for reading this.

I had a message from a friend recently to say that he'd heard of software
which was available for the SoundBlaster card that enabled it to handle
cw, rtty, sstv, etc.

I think that a 9H1 was the source, but try as I have I can't find any
more details about it.

I wonder if this is one and the same thing??

> Tnx in advance, 73! de RX3DIN Victor

This should be quite interesting, since commercial equipment is favored by
most large packet systems and the FCC requires a rolloff of 6 dB/octave
starting at 2500 Hz and most manufacturers also include an LPF at 3100-3400
hz. Remember to set your transmit deviation so that the high tone does not
exceed 5 kHz deviation or the non-linearity in the receiver IF filters will
destroy the data.

Actually they gave you a HUGE amount of information, at least when compared
to what you get from most warranty repair shops that just say "Repaired
under Warranty." Here's what they did:
1) "Repaired APC (Automatic Power Control) Circuits" which means that

there was a problem in the tx power sensing on the 2M side;

2) "Resoldered all joints and do corrective/preventive repairs on TRX unit." Well, the first part is self-explanatory; apparently they are having problems with cold solder joints on the assembly line. The second section is very vague, but they may have upgraded the power rating of some components in the PA.

3) "...and APC 023 protect mod." This confirms it, there is a factory-required upgrade on the Auto Power Control board. If you access the Kenwood BBS you can get a copy of that service repair note for your files.

4) And the testing results after their service and modification were: "Full function test rx/tx GOOD. 2 mtrs po 50/12/5 Stable." So THEY think it is working within the published specs. Remember that Kenwood only warrants the unit's performance and tests it WITHIN THE AMATEUR BANDS. If you program in anything outside the band (or the MARS/CAP modified band) you are strictly on your own, including the cost to repair even while under the normal warranty.

And, since it died again, you did the right thing by immediately returning it for investigation and repair. The only thing you didn't mention was that hopefully you did call them to discuss the situation before you put it in the box a second time. Repair facilities usually want to know immediately if there is a repair problem on a specific model. The manufacturer will usually stop repair of all other units of that model and problem until your re-repair can be diagnosed and a proper fix found. Nobody wants to spend time repairing a unit more than once, because the PR is terrible when that happens.

4326. Help, PK-1 documentation

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-22 23:01:19 UTC
From: ab728@rgfn.epcc.edu
Message-ID: <1994Nov22.230119.15422@rgfn.epcc.edu>
Source record: 46270

A friend of mine, Art - KC5EFM, has a PK-1 tnc but has no documentation
on how to properly hook it up to power, his radio, or computer.

Any suggestions or pointing in the right direction would be appreciated.

73,
Bill

4328. HF packet e-mail with a MAC from a sailboat?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-23 00:09:50 UTC
From: jeff@venus.rand.org
Message-ID: <3au18e$t2q@venus.rand.org>
Source record: 46269

I am trying to help a friend who is about to embark on a long voyage in a 40 foot sailboat. He would like to investigate the possibility of establishing an e-mail link that would work over long distances (i.e., from mid-ocean). Ideally, he would like to be able to use his radio and computer to send and receive e-mail to anyone with an e-mail account with any service connected to the Internet; most of these people would not be hams.

He is planning to sail down the West Coast of the U.S. to the Panama Canal, go through to the Caribbean, sail the East Coast for a while, eventually cross the North Atlantic by way of the Azores, and wind up in Europe. He is not a computer or technical expert, but he has a ham license and a fair amount of radio equipment on board. He will also be carrying a MAC Duo 230, so he will have some computing power available--at least as long as the Duo can continue to function in a marine environment. Note that since the boat is a sailboat, aimed antennas are out of the question--satellites do not offer a solution. Similarly, power is a limited resource on a sailboat, so it is not feasible to leave a radio or computer on for long periods of time.

I am a computer scientist but a "lapsed" ham, so I am not up to speed on what is available in the way of packet radio or for that matter what bands might currently offer good coverage for the kinds of distances he will be facing; nor am I clear about what would be involved in setting up an e-mail link for him (he has no institutional affiliation that would provide network access, so presumably he would need to buy access via a commercial service). He has one or two ham contacts with whom he has arranged regular contact, so it is possible that one of them could maintain a network link for him and relay e-mail to him, but it would be nicer if he could establish a direct link to some kind of server. Whatever he does must involve software that can be run on his MAC, using a reasonably inexpensive interface to his ham equipment, and which he can use with relatively little expertise. Ideally, the hardware and software interface should be capable of being replaced by something equivalent for a PC, in case the MAC dies during the journey and gets replaced by a non-MAC machine (I personally wouldn't bet on ANY off-the-shelf computer surviving for very long in salt air).

I have scanned this newsgroup and gather that almost all packet radio stuff is done with PCs, not with MACs and that to interface between a computer and a radio, one needs either a packet modem or a TNC (which includes the modem). I also gather that using HF would effectively limit baud rate to around 300. Still, I am unclear about how one "connects" to a packet/Internet gateway or what such a gateway consists of.

I would particularly appreciate an overview of how Internet e-mail and packet interface with each other and how one might use a radio on a sailboat to send and receive e-mail to and from people on the Internet who know nothing about ham radio. All advice gratefully accepted.

From: cwyatt@netcom.com
Message-ID: <cwyattCzp5nn.6wL@netcom.com>
Source record: 46272

Hi there,

I've owned this MFJ 1278 for a couple of years now, and I'm wondering if anyone has a handle on some decent software (shareware/freeware???) that might be available for it.

Personally, I think the thing is sort of a dog, but perhaps with a decent interface to work with, it might not be so bad.

>Kam, KPC-4 or PK232 for the tnc and the radio is no problem.

One of my reasons for getting into packet was to waltz around with a KPC3, HT, and HP-100. It isn't quite small enough to carry everywhere, but I did have some fun sending E-mail from odd places (like a ski lift around 7000' up Mt. Hood :).

I just used the built-in datacomm program (the HP95 has nearly the same thing; the main difference is the screen resolution). On the HP95, you'll have trouble running most of the MS-DOS packet programs both because of disk space (unless you have a large SRAM/Flash card) and because of the screen resolution (it's a pain panning around to see 80x24 characters).

Source record: 46341

I am using a MFJ-1270B and would like to know how I can upgrade to MFJ-1270C with the mailbox option. Please can anyone direct me. How much will this cost me?

Another problem I have is with my use of the TNC with Telemate program. I find that when using DTE speeds of anything above 1200 baud, everything seems to work fine except when I try to past a bunch of text to the TNC. That is a dump, and then I start losing characters. I have checked the handshaking and the cables, and associated handshaking parameters but cannot understand why there is lost characters. Right now I have to use 1200 baud speed for computer connection. Can anyone advise?

Actually the term "micro controller" might be a better choice. The AEA and most other TNCs which are based on the TAPR TNC2 designs use a Z80, a nice, modern 1970s class microprocessor. It's fine for the simple job it has, though most of the designs suck down way too much current for this day and age.

Kantronics broke from this approach long since, and produces TNCs which use very little power, and use more modern circuitry. They do all the HDLC in software, which provides them lots of flexibility (and the ability to fix most any problem in software, rather than hardware). I noticed that AEA has finally come around on this and produced a software-implemented TNC.

>why you have to run all of the drivers to get it to work, that's becuase you
>your PC is the computer for the Baycom, while a REAL TNC you can have your PC
>turned off and it's STILL keeping track of your mail. Mini Computer.

The other major advantage to running a real TNC (read: an outboard microprocessor providing modem, PAD, and HDLC service) is that your main computer is able to communicate with the device in an asynchronous fashion. This means that when your computer is ready to, it can send characters, and the TNC will take care of getting the data out on the air. If you're using your expensive computer to do this, don't expect to be able to run too much else at the same time. DOS generally runs one program at a time. Windows, OS/2, Unix and variants are not accustomed to that.

You CAN force most of these systems to do something useful with a baycom modem and brute force, but true synchronous hardware or an outboard TNC would do a much better job. The outbaord TNC is likely a cheaper solution than a decent, commercially available sync-serial card and a modem.

I had a Kantronics UTU (Universal Terminal Unit) a year or so ago. I paid abt
$15 for it at a hamfest. It will decode CW/RTTY/AMTOR(FEC), and encode it too.
I sold it this past summer for abt the same, when I was trying to clean house.
Keep an eye for them at hamfests.

>I wounder if there is any way to recive SSTV bu DSP2232 and which
>program can be used.
>any help is highly appreciated .de Ibrahim.

Well I am not sure if the two units work the same as far
as the Analog mode is concerned, but I have been
using JVFAX 7.0 with my PK900 and it receives SSTV
exceptionally well.

Here is the method that I use.

1. Start a terminal program configured for the unit.

2. From the command prompt, type ANALOG <enter> or
the correct Modem Command.

3. Exit Terminal Program.

4. Start JVFAX 7.0.

5. Set the JVFAX interface to COMPARATOR.

6. Set JVFAX to the proper Port Address and IRQ.

7. Start the SSTV or Fax modes.

Note : I have foung that the program works well, but it
it did require loading a VESA TSR driver before it
would copy in color.

I think that your best bet youd be to get a copy of NOS that has been
compiled for OS/2. There are two that I know of, one that is text based and
on that is PM based.
I'm currently using OS/2 2.1 and have found that any serial communications
through DOS emulation is very slow. I don't know if they've fixed this is
WARP but I know trying to use a plain modem (telephone) at 9600 baud brings
my 486-33Mhz to a crawl. OTH, using similar software to do the same stuff
but in native OS/2 doesn't put hardly any dent in the system...
I don't currently run any packet software, but I suspect it would suffer from
similar problems.

Good Luck,
Ross

: I am trying to help a friend who is about to embark on a long voyage in a 40
: foot sailboat. He would like to investigate the possibility of establishing

Hi ...
I have a number of users of the HF port on my BBS. One spends the summer
in the Carribean on a sailboat. He uses a wind driven generator to charge
batteries.
There are two main modes of digital HF communication. Those are GTOR and
Pactor. There are also those who still use and swear by RTTY. There are
those who use HF packet effectively. However, if you want to move data and
get into and out of a BBS on HF, Pactor and GTOR are the way to go.
From my own use, I know that I can get back to the area where I live
from anywhere within about 400 miles anytime day or night. This is about
85-90% reliable. When 80 meters goes long at night, things get slow.
For info on longer trips I draw on many HF users who are located in the
Carribean and South America. Depending on band conditions, it would be rare
when a link could not be established.
For antennas, I have found that a mobile mast and resonator (Hustler)
which is mounted on the luggage rack of my motorhome (for portable operation,
obviously) is as effective as a dipole or trap vertical. There is not that
much gain to be had in the large, hard to transport vertical and the hard
to set up and take down (and set up and down and up and ...) dipole. I am
sure that on 20 I would prefer a beam for rejection.
You both need licenses and both need to set up stations. Do it right!
Most TNCs are coming with built in mail boxes. Setting up a small
BBS outside of the TNC is not that big of a challenge.

In the MFJ ad in the November, 1994 issue of QST, the price for the latest
1.2.9 firmware is $19.95. I would guess that this would give <10K for
the mailbox. Memory expansions boards are $49.95 for 32K, $69.95 for 128K and
$239.95 for 512K, including the firmware. This might not be exactly the same
as a 1274C, but functionally pretty close.

I think you'll find it at ftp.ucsd.edu, called psator__.zip.
I haven't tried it out, but downloaded it quite some time ago.
It's in /hamradio/packet/tcpip/incoming I think.

Thank you for the information.

Anyone familiar on where I can get a OS/2 implementation of NOS?

4353. Making the IC38A work at 9600

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-24 16:49:50 UTC
From: goobie@cfcsc.dnd.ca
Message-ID: <goobie.66.053B219B@cfcsc.dnd.ca>
Source record: 46354

I have had a few request for this information, so here it is:

The rx audio comes off the discriminator. What we used was the feed point on
the connector that feeds the optional PL board.

TX goes into the varactor for the unit.. It is at the junction of two diodes
on the tail end of the audio modulation section. It is after the pre-emphasis
system on the radio.

You cannot feed the audio directly into this insertion point. Most G3RUH compatible
units are always generating audio even if the TNC has nothing to transmit.
The varactor on the IC38 is also used in part of the receive circuitry and
this constant audio willtake the receiver off freq. Therefore this audio must
be gated.

On the Tiny 2, there is a readily accessible audio gate that they use for the 1200 bps
stuff..
We disconnected the 1200 modem and inserted the 9600 audio in its place..
The gate is a VN10 fet on the board.

The TM331 info can be obtained from KE2VW @ KE2VW..

Obviously there are three ways to increase through :

1. Increase speed, that is what we are doing

2. Get radios with fast TX keyup

3. Go full duplex

The IC38A will work with a TXD of 15.. The TM331 can be made to work with a TXD of 20..
Our D4-10 network uses a TXD of 30 ms..

The TXD is not the best, but we are now moving a tremendous amount of data.. We see in
the order of 10 Megs of data a day through our 19K2 / 9K6 networks..

Cheers
Keith

4354. Kenwood TM 451 and 9600 packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-24 17:05:25 UTC
From: goobie@cfcsc.dnd.ca
Message-ID: <goobie.67.0549679E@cfcsc.dnd.ca>
Source record: 46355

After much waiting, I finally was able to get my hands on a Kenwood TM 451 for use at 9600. Our desire to get this radio was based on the recommendation that the Kantronics people had extremely good success with the KPC 9612 and the TM 251. Making the assumption that Kenwood would be using similar design concepts, we were prepared to wait for this product.

ASIDE : assume - makes an ass of u and me

Our initial research has show that the radio does indeed make a very good radio for doing 9600 bps packet with the KPC 9612, the PK 900 and the PK96. The Kantronics folks have even suggested that they were able to make the TM 251 work at 19k2. We did some long data transfers and all worked quite well with the 451.. The KPC 9612 did not have it equalization adjusted for the radio, but with the BER port that is available on the unit, tuning was easily accomplished.

Now for the bad news: The TM 451 is as broad as a barn door and lets everything in. This was a very big disappointment.. It readily picks up intermod (which for a UHF radio is not a good indication) which will obviously impeed effective 9600 communications. Based on the small size of the radio it is obvious that Kenwood has turned itself into a computer company (with all the features that they have available on the unit) and the radio business is nothing more than a sideline. The unit is more a computer and with the small footprint of the unit, it is obvious that they forgot to put in the front-end. I think it is high time that Kenwood started to build radios again with effective intermod suppression and if that means bigger, I am quite content with that..

As a result , I am now waiting to get my hands on a Yaesu unit to run similar tests.. Hopefully they will be building units that a little better in the front end.

Cheers
Keith

From: bob@clark.net
Message-ID: <bob.4.0011AAA1@clark.net>
Source record: 46347

Help. I am looking to communicate with my Brother and Nephew who are hams via Internet Email.

They run on Packet as KA3ZVJ and WY3A (packet address WY3A @ KA3VSP.#EPA.PA.USA.NA). Can I send EMail to them now, can they send to me? They live in Philadelphia and I live in Washington, D.C. It would be nice if they did not need to pay an Internet Access Provider to send me mail.

Additionally, it would be nice for them to be able to use Mosaic etc. over AX25 or other digital radio protocols.

Anyone out there who can give me a tip, I'd appreciate it.

If you please, send Email since I do not regularly read this group.

TIA,

:

I don't know about the fellow in the boat but for me, HF is the answer.

The satellites never were an option due to the cost, dependence on others and the need to link to a _station_ rather than to the network. Linking to the station gives you the ability to bypass the networks quirks. It also allows real time QSOs should the need arise. There are tons of advantages to drawing a line between two stations and using it. You also have many, many other stations should the need to enter the network become necessary. Even a QSO could be used to forward your data.

Yes, and it works fine here...
>
>Is it a straight forward process, or any hints?

Pretty straight forward...I'd recommend using a batch file to handle
any "nos parameter" passing and directory pointing that you might
do. The other tip is to set the "video_mode_restrict" setting to CGA
to free that extra chunk of base memory...

Make sure your com ports are addressed correctly (if need be) in OS/2's
config.sys, etc, and it should run fine...

You might try XPCOM, it was originally written for the 1278.
you can ftp the program from

ftp.indirect.com

software/msdos/hamradio/xpware

Filename is XPCOM154.ZIP

I don't know about the fellow in the boat, but HF would be my choice.

I need to connect to a particular station. Once there, I can read, leave mail
or chat real time. I am not depended on the sats, the cost to get on them or
the need for them to be working. In fact, if I can't make that one station,
I have many others to choose from. I haven't given up the benefit of being
able to connect to the network.

It is nice to plug the mic or key in once in a while, too. The equipment
is more servicable. Etc.

4362. Baycom HELP!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-25 11:39:22 UTC
From: J.FRisby@herts.ac.UK
Message-ID: <Pine.3.87.9411251122.A15194-0100000@altair.herts.ac.uk>
Source record: 46357

Hi there, I wonder if somebody might be able to play some light on a problem I am having! Well I run a Baycom (7910) with NOS using the AX25v3 packet driver. It ran fine on my 286 PC. But I know have a 486 it I get nothing out of it at all. I have tried removing all memmory managers but still nothing at all. I power the modem directly from the serial port. I have tried using a external PSU but that make the rig TX flicker a bit, so I was wondering if perhaps there is a n earthing problem. It is driving me up the wall, as I need to get rid of the 286 as I just don't have room for it, so I really need to get the baycom working onthe 486.

If you have ANY suggests at all please let me know.

Thanks

4363. Ethernet card help!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-25 12:10:03 UTC
From: J.FRisby@herts.ac.UK
Message-ID: <Pine.3.87.9411251203.E18015-0100000@altair.herts.ac.uk>
Source record: 46358

This might not be the best place to ask these questions, but I wonder if someone can help me.

I have 3 ethernet cards, one true Novell NE1000 card and two SAGE 8 bit Ethernet cards. The SAGE cards were made in 1990 and the only thing written on them is "8 BIT ETHERNET CARD". Does anybody know anything abt these? I have no software for them at all. I want to run them with NOS to require a Packer driver. There is also "000F85" on a label stuck to an IC, would these be the cards address??????

Do you happen to have or know a way how I can find out what Packet driver I should use and HOW DO I FIND OUT WHAT IRQ they are using, is there some software available that might help me? I have no paper work for either the NE1000 card or the SAGE cards, so any help would be more than useful!

Thanks.......

Jon G8DJU

A friend of mine just upgraded a 1270b. It either cost him $19 or $35,
something like that (you just replace the EPROM as I recall), but he also
added the ability to receive weather.

I am not familiar with the Telemate program, but if you are losing
characters, that means you are overrunning the buffer and that has to be
a handshaking problem.

Don't hold your breath. At HF, the companies have moved the tuning
equipment outside the radio so that they can sell you another box
to give back the knobs they took away. At VHF/UHF, you now have to
buy an external bandpass filter to restore the narrow front-end that
the scanner enthusiasts and out of band operators wanted removed.
Fortunately for packet, it's no big whoop since you'll normally be
operating on a single frequency anyway, and a pass cavity can be
inserted in the line. It is annoying, however.

A friend is going to sail his sailboat to europe. While he has an Extra
ticket, he hasn't been involved for a couple years in ham radio.
Is it possible to use packet on HF and send and receive e-mail through
internet?
If not, anybody know of anyway to accomplish the same?
Your help and advice is greatly appreciated.
You can send your responses to me at:

john.avery@uchoice.com

Thanks.

You can subscribe or unsubscribe to any of the various campus mailing
lists and the local redistributions of global mailing lists by sending
email to "listserv@ucsd". The commands understood by the listserv
program are:

HELP
lists this file. This is also sent whenever a message to
listserv is received from which no valid command could be
parsed.

HELP groupname
lists a brief description of the group requested.

INDEX
lists all the groups available for subscription.

LONGINDEX
lists all the groups and their descriptions.

ADD listname
DELETE listname

ADD address listname
DELETE address listname
adds or deletes the given address to or from the list
specified. Mail is sent to the address given to confirm
the add or delete operation. We strongly recommend that
you use your campus registered mailname when subscribing
(i.e., use the second form of the command which includes
a specification of the address). If you omit the 'address'
the command will assume the mailbox that is in the From:
line of the message. Note that SUBSCRIBE is a synonym for
ADD; UNSUBSCRIBE for DELETE.

DELETE-ALL
UNSUBSCRIBE-ALL

DELETE-ALL address
UNSUBSCRIBE-ALL address
unsubscribes given address from all mailing lists. Mail is sent
the address given to confirm the deletions. If you omit
the 'address' the command will assume the mailbox that is in
the From: line of the message.
LIST

LIST address
lists all mailing lists to which the given address is subscribed.
```

If you omit the 'address' the command will assume the mailbox is
in the from line.

FAQ

FAQ listname
sends a list of "Frequently Asked Questions" for the appropriate
mailing list. The command "FAQ" by itself sends an index of
available FAQ's.

INFO

INFO filename1 filename2 ... filenameN
GET filename1 filename2 ... filenameN
sends a copy of the appropriate information sheet associated
with each file name. The command "INFO" by itself will send
an index of available info sheets.

FAX faxnumber filename1 filename2 ... filenameN
sends a fax of the appropriate file to faxnumber. Faxnumber
is the phone number of the desired fax machine, including
any necessary dialout prefixes. Fax machines on UCSD's Ericson
telephone system are best accessed using their 5 digit extension.
The command "INFO" by itself will send an index of available
documents.

A command must be the first word on each line in the message. Lines
which do not start with a command word are ignored. If no commands were
found in the entire message, this help file will be returned to the
user. A single message may contain multiple commands; a separate
response will be sent for each.

Please note that is IS possible to add or delete someone else's
subscription to a mailing list. This facility is provided so that
subscribers may alter their own subscriptions from a new or different
computer account. There is therefore some potential for abuse; we
have chosen to limit this by mailing a confirmation notification
of any addition or deletion to the address added or deleted including
a copy of the message which requested the operation. At least you
can find out who's doing it to you.

Examples:

add sunusers

add ewombat foodlovers

delete wombat@cyberpunk.ucsd.edu connectionists

help eggbeaters

Note that although you would mail submissions to a campus mailing list by
addressing mail to e.g., sunusers@ucsd.edu, in a subscription request
you specify the name of the list simply (without the @ucsd part) as in

the first example above.

4370. Re: Packet and HP-95

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-25 16:46:49 UTC
From: philkeys@olympus.net
Message-ID: <philkeys-2511940846490001@ptpm013.olympus.net>
Source record: 46365

The FTP site for HP95LX has communications programs (Commo, Kermit) and even a stripped down version of TCP/IP (NOSHP). The site is eddie.mit.edu pub/hp95lx.

I am currently getting Commo running on my HP95LX. I found that the built in COMM program has a very small buffer (doesn't save many lines scrolled off yje screen).

I am setting up portable packet for Search & Rescue.

Howdy,

I am looking for an ASCII version of the docs for JNOS 1.10g or
equivilent. I have the latest Buckmaster CD-ROM with the docfile on it
but it is formatted for 2 specific printers, neither of which I have. I
have looked around several ftp sites and found other versions for 1.10
but none for 1.10g. If such a creature exists, I would like to get a copy
of it. Thanks for any help.

Ken - First things first. Are you running compressed 9600 baud (i.e. takes up standard 5KHz deviation?) If not you wont legally be able to run it on 222MHz band. If so than any radio you can convert to transceive in band will most likely work fine. We have converted G.E. regency and Pheonix radios both xtal and synthesized work fine. You simply find good spots to inject TX audio and recover RX audio. Then adjust these levels to produce proper amplitude/deviation. I can help with this if needed. We are running TINY-2 Paccomm modems. We have modified the radios for 440 9600 baud, but have modified others for 222 FM voice so can recommend some VHF-HI banders that will do 222.

Please reply to this account via mail/usenet if any questions.

First of all Hello,
as a ham on the east cost and being into this tcpip thing since getting
my licence, i have learned alot. Now that Linux is avalible and working
i wanted to get my tcpip box and my linux box to work together. This project
which will take a year to complete du to my hectic sced, will aloow hams
(NYC Primarilly) to sent mail back and forth to the net. Also i will
attempt to have the rec.radio groups avalible for radio browing. This
setup is currently using my tcpip setup, running jnos 110g and my linux
setup runing 1.1.64. it took a while, but i actually have them sliped
together and they can send mail back and forth. I thought by posting
this, i would see how many NYC and metro hams would be intrested in
something like this. Since i am in school the majority of my time, i
nolonger keep any radios on, but i can be reached at this account
If anyone has some suggestions or comments, feel free to respond

Does it drop characters with procomm, procomm+, or other known good terminal
programs? Did you change the factory defaults? Are you sending in
transparent mode when telemate expects XON/XOFF flow control (transparent
defaults to no XON/XOFF)

I have high ambitions here: can anyone point me at a likely spot
to find source for a driver for a DRSI type II (serial ports, no
modem) board ? This should keep me out of the pool halls for some
time. I'm told the Linux folk have AX.25 drivers for this board;
this would be a good starting point for an OS/2 driver, if I could
find source code for this or anything that used an 8530 chip.

If you can make do with VHF, the BAYCOM modem and software is the way
to go. The software is shareware, and the PCBs for the modem are quite
easy to get hold of, here in the UK, at any rate. Mine cost me less than
#20 to build - $40 or so. Ramsey do a kit for this system, which isn't
very expensive.

ABLACKBELT (ablackbelt@aol.com) wrote:
: Help needed on solving the problem of multiple serial port connections. My
: last computer had a parallel mouse and left just enough room. Anyhow
: problem is this......
: Mouse is com1

The first thing I did with this problem was purchase ($13) a "serial bus mouse" card. This isn't really a good name, but that's what Mouse Systems called it. What it *really* is is a single serial port card addressed to (if memory is recalling without parity errors) 0x0238 port address, and I selected IRQ5 for the interrupt. That freed up COM1 for more important tasks. The board comes with a modified mouse 8.0 driver (a little out of date, but completely functional).

: internal modem is com2
: I know that Com1 and 3 share same irq and 2 and 4 share same irq. I

As another respondant said, you can use different IRQ's for various COM3/4 ports, as you see fit (assuming that your serial port board allows you to jumper the IRQ). The usual system config is:

IRQ Function
0 System timer
1 Keyboard
2 Diskette (XT) or IRQ9 (AT)
3 COM2, default for COM4
4 COM1, default for COM3
5 LPT2 (2nd Parallel Printer)
6 Hard Disk (AT)
7 LPT1 (Parallel Printer)

Thus, IRQ5 makes an easy first target (unless you're already using IRQ5 for something else, like a sound card).

Here's a message that went around on packet early this year that explains the mod for UHF micors, I think it will also work on VHF. You can contact the author and see if he knows more.

Bill N8KHN
healy@moriah.ee.unr.edu

Revised UHF Micor Modification...
R:940515/2054z @:N7MRP.AZ.USA.NA #:57647 [FBB-Internet-Gate-Phx] Z:85016

From: N7MRP@N7MRP.AZ.USA.NA
To : MICOR@USA

This is an updated text file containing the MICOR 9600 Baud operation modification. The only major changes are the X-TAL filter changes and the wiring of the first stage of the exciter board "hot." The changes are noted with a > in front of the text.

First, the MICOR was modified for "stand alone" operation (without a control head) - on P901 (the big connector in the front), pin 11 is jumpered to pin 1 (Gnd), pins 8,3 & 22 are connected together and to a 2amp fuse connected to the big A+ feedthru going into the PA. All these jumpers are done on the control(interconnect) board, except for mounting the fuse itself. Unless you want speaker audio to listen to, there is no need to install volume or squelch pots, and the audio amps are not used in this application.

Second, we did a couple mods that seem to help prevent problems before they arise: add a capacitor (at least 20 microfarads, I use 220 uf) across C903 on the control board (this is the tubular electrolytic located just to the rear of the 9.6v regulator transistor heatsink). Add a diode (1N4001 or better) from P901 pin 16 to any of the A+ pins (3,8,18), with the banded end to the A+ pin. (this is a "spike" suppression diode)

Third, one mod on the Audio/Squelch board: replace C203 with a 1-10uf electrolytic/tantalum- I recommend at least a 20v rating. This improves the low frequency end of discriminator audio.

If your radio has a CTCSS encode board plugged into the exciter,
remove it. Install JU304, which is located immediatly adjacent to the
encoder board connection on the exciter. Depending on which exciter you
have, the encoder will have either 7 or 11 pins - in either case the pin
you will use to inject transmit "audio" is the one adjacent to the big
square hole, towards the outside edge of the radio (pin 6 for 7-pin, or
pin 10 for 11-pin ones). Connect a shielded lead from this pin to an
unused pin on P901 (I use pin 27). On the exciter, trace the land from
the pin you just connected to and you will find an 82k resistor -
replace it with a 10k resistor (1/4w) and a 10uf capacitor in series.
(Some exciters already have a 6.8uf cap in series - if you are SURE
yours has the cap, you don't need to add another!

> On the receiver RF/IF board, remove the SENCOND (2nd) and FOURTH (4th)
> crystal filter "cans" that come after the IF amp, and replace them with
> 1000pf disc caps (not critical). Note that the caps DO NOT connect to

> TXD of 12 or 13 is just right and I have continued to maintain a retry rate
> of 0-1% for the past 2 years now on all links that contain MICOR/MITREK
> mixes.

Thats ALL there is to it - naturally, you need to tune the radio up,
but I figure you already knew that! Connect your transmit audio to
whichever pin you connected the jumper to, receive audio (discriminator)
is on pin 20, PTT is pin 16, and 12v goes to the two big pins in the
middle (pins A and B).

I would advise obtaining a service manual for these radios if you plan
on using them - it is Motorola part # 68P81015E70, and you should be
able to order one through any Motorola service shop.

The original mod was written by Hartley J. Gardner, W1OQ@N7MRP.AZ.USA.NA
and implemented by Daniel J. Meredith, N7MRP@N7MRP.AZ.USA.NA

The revision to this mod has been worked on by both of the above mentioned parties and has been revised by Daniel J. Meredith, N7MRP@N7MRP.AZ.USA.NA

Ma> I am looking for info on PACTOR able TNC's. Anyone have some
Ma> comparision of effectiveness of different TNC's while using this
Ma> mode??? Also how does PACTOR compare with GTOR ?? I am interested in HF
Ma> packet alternatives.

Martin, I use PACTOR daily on 80 meters on a sked with a friend.
I use an AEA PK-232MBX and he uses a Kantronic KAM-Plus. Both
seem to work very well so I suppose it's just a matter of preference
among individuals. Of course, this operation is not the same as one
might experience say on 20 meters looking for contacts around the
world. In other words, I can't comment on which would be the best
under heavy interference and poor conditions one might encounter there.
I have made other contacts than my sked station with very good results.

I have no experience with the MFJ-1278 (I think it is) that will also
operate PACTOR.

As for G-TOR, that works only between two KAM-plus TNC's so I don't
have any input to give you. I understand it is about twice as fast
as PACTOR under good conditions but shifts down when the going gets
rough.....but so does PACTOR!

Martin S
I am looking for info on PACTOR able TNC's. Anyone have some comparision of effectiveness of different TNC's while using this mode???
Also how does PACTOR compare with GTOR ?? I am interested in HF packet alternatives.

Thanks.
Martins@digex.net

John - I use the HP-95 and a KPC-3 frequently for portable packet ops. I simply use the built in COMM program! The only negative is that there is no way (that I have found) to PASTE to the COMM program...so everything has to be done real time...Give a holler if your friend needs help.

Version 1.7 is at the anonymous ftp site ve4umr.ampr.org in the
/pub/terminal subdirectory. I don't think Lan-Link 2.32 is there but, as
soon as I figure out how to insert programs into E-mail, I can send you a
copy.

From: jcksnste@ACFcluster.nyu.edu
Message-ID: <3bacgl$51p@cmcl2.NYU.EDU>
Source record: 46192

Good morning everyone..

In case no one else has done this, here's my setup:

386sx-25 desktop and a 386dx-20 laptop; JNOS 1.10g. I priced some ethernet paraphernalia at around $400. I decided to try a 10' serial laplink cable from CompUSA for $8 and it works just fine with the two machines configured with slip connections.

My question:

My intention is to leave the desktop on 24-7 with the internal TNC. Then, I'll connect the laptop each morning and download my mail and bulletins via POP so I can read and respond while at work. Then I'll upload my replies nightly.

I was able to finger, ftp, and telnet across the wire without issues. When I telnetted to the desktop and sent mail to an account on the desktop, the hostid in the From line read (null) and forced an SMTP error.

How can I set that address? I think it's the hostid command on the desktop, but I'm not sure.

I also see (null) near the JNOS version on the telnet welcome screen, if that helps any.

I passed in early 9/94 and really want to hit the ground running, so any help would be greatly appreciated.

Oh, and one more thing, are sysops usually good at making SMTP arrangements at 1200 baud in 2m anymore, or will they only deal with 9k6 and up? I can't afford any more radios any time soon and know that there's a network node less than a mile from me. Should I call him and ask him, or sign on and discuss via his PBBS after my ticket arrives?

Many thanks.

Steve (passing time by studying JNOS and my General book)

I've browsed over numerous mail (& mag.) articles recently getting up to
mental readiness for packet radio. With todays 14.4k phone modems
spoiling us for speed, I feel 1200 b.p.s. will be so S L O W that use
will cease after the novelty wears off !! Has anyone one any ideas on
some Baycomm style approach that allows at least 9600 ? Additionally
I'm considering a "non ham" radio link using several VHF or UHF freqs
open for all here in New Zealand. (I teach electronics & computer
technology here in N.Z. at a Polytech & plan a class project next year)
Has anyone ideas on a mile or so packet setup along LAWN lines ?

Best reply to work swan@eng.wnp.ac.nz (or here. 73s ZL2AJZ

you should be able to use the terminal program that came with os/2
for a start (both the softerm version and the windows terminal...)

if you have in mind something that tracks stream switches and all that,
i don't know of one off hand.

should be able to use the dos ones tho...

In a normal AX.25 packet network, the "hidden" transmitter problem
will cause some collisions when all stations can not hear each other.

A marginal link will also cause retransmissions.

In a token ring/token buss configuration, in addition to transfering
the actual data between two stations, you must also be able to pass
the token from station to station in a sequential way. If all stations
can not hear each other directly, the sequence must be ordered in such
a way that each station can hear the previous station and be able to
pass the token to the next station in the sequence.

If you have marginal links (e.g. QSB), the token can get lost. The
remaining stations will eventually recreate the token and reconfigure
the ring and the actual data traffic can resume. If this happens
frequently, it will reduce the total throughput, even if no data is
transmitted from the station with marginal links. In a normal AX.25
CSMA (Carrier sence multiple access) network the total throughput
is reduced only if there is actual data from the "hidden" station
(due to collisions).

If a link fades in and out in a token ring system, there is always
the risk that the ring is split into two or more independent rings,
which is a really nasty thing in this kind of network.

IMHO, a token ring network might even work, if each station can reliably
hear each other, but if you have hidden transmitters in the net,
there is a risk that at least the standard token ring protocols
might loose the control of the situation.

I was told by the German authors of Baycom, that 1.6 has been sent to PacComm over 6 weeks ago for distribution. And, I sent an order in for it last week. Costs $26. Remember, Baycom software from version 1.5 is NOT shareware or public domain. Previous versions (1.2, 1.4) were. This 1.6 cannot be uploaded to any server legally. PacComm is (to my knowledge) the only legal place in the USA where you can obtain ver 1.6. -pat

SCHEMATHEEK. De schematheek in Eindhoven is WEER uit z'n jasje ge-
------------ groeid. In de woning van beheerder PD0MHS bleef wat al
te weinig leefruimte voor Toine zelf, z'n XYL en de kids, om maar te
zwijgen over de twee kleine hondjes (voor een grote hond was hele-

maal geen plaats). Had de XYL dan toch gelijk.? 'Een postzegelverzameling is handiger.' Onverwacht snel is nu een grotere woning ter beschikking gekomen. Dit houdt in dat de rest van dit jaar alle energie en vrije tijd moet worden besteed aan verhuizen, behangen, inrichten, enzovoort. De schematheek activiteit gaat dus 2 maanden lang op nul. Stuur alstublieft geen aanvragen in 1994. De aanvragen die binnen zijn, zullen eerst moeten meeverhuizen. Met ingang van 1995 hoop ik weer zoveel mogelijk mensen van dienst te kunnen zijn via postbus 4228, 5604 EE Eindhoven. De nieuwe schematheek inhoudsopgave is in de meeste BBS's beschikbaar, eventueel met behulp van het REQFIL commando uit PI8ZAA en uiteraard ook in area HAMRADIO van FILELIFT BBS, 040-123677. Tenslotte wil ik langs deze weg iedereen bedanken die middels het opsturen van doc's, heeft meegeholpen de verhuizing noodzakelijk te maken. 73', Toine PD0MHS.

Interesting that when I owned first a KAM and then a KPC4, neither was
very good on a busy channel - obviously the poor CPU was still rushing
round sorting out what it had received and never got chance to transmit.
Neither was any good when I wanted to upgrade to run 9600baud either -
there is a limit to what you can get a micro to do without a bit of
extra help!

For people interrested :

I've a KAM Plus (include PACTOR and G-TOR mode) for sale.
For HF and V/UHF packet and other for me it's the best.
Much better than a PK232MBX because of HF AND V/UHF at the same
time !!

Is anyone out there able to program the rom in a 2 channel Pheonix
radio? If so please let me know. I have the programer for the 16
Channel version but it has no where to plug in on this one.

4413. Repost of TNC comparison available?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-28 18:58:42 UTC
From: "F. Kevin Feeney" <fkf1@cornell.edu>
Message-ID: <3bd992$ss4@newsstand.cit.cornell.edu>
Source record: 46205

Hi,

A while back someone posted a very detailed comparison of the KPC3,DRSI, and I think Tiny-2 mini size 1200 baud TNCs. I carefully saved it away, knowing I would want to refer to it when the time came to purchase such a critter. The time has come, but I can't remember for the life of me where I stored the file. :-(Would the kind soul who did it back then consider emailing me a copy, or maybe posting it again for other's use also.

Intersted in flexibility, ability to put a satellite modem on it, BBS functions, etc. Thanks

Kevin, WB2EMS

4414. AEA PK-900: Opinions and Comments

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-28 19:01:35 UTC
From: jmonaco@dorsai.org
Message-ID: <CzzrIn.DoG@dorsai.org>
Source record: 46206

I am considering the purchase of an AEA PK-900 multi-mode TNC. I would appreciate any comments, both pro and con, from anyone that has used this piece of equipment. A friend of mine has a PK-232MBX which I think is a fine unit, but it lacks simultaneous dual port operation. I have also considered the Kantronics KAM, but have heard that it does not perform as well as the PK-232MBX under poor HF conditions.

Thanks in advance for your opinions.

4415. Packet Transmission

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-28 20:29:54 UTC
From: mbunney@bank8.u.washington.edu
Message-ID: <3bdek2$esr@news.u.washington.edu>
Source record: 46207

I recently purchased an AEA PK-96 along with an ICOM 281H mobile radio and couldn't wait to get online and converse with someone. After wiring up the radio to the TNC, I was able to pass the loop back tests and finally started to read some packet mail on my screen. I use procomm as my communication package. Here is where the problem starts. I try and converse with a local station and I can see the TNC sending out my transmission, but after five trys the TNC tells me it has timed out. I have set the 1200 baud deviation pot on the back of the TNC to the factory recommended setting. I have even tried to set it by using the TNC tone method--but still no luck. I do not own a deviation meter and I hate to have to buy one just to set the initial deviation.

What am I doing wrong?????????

Thank you in advance for any help.....................

> Thanks in advance
> Lapo Pieri IK5NAX

Lapo, the G3RUH modem uses FSK. It is designed for direct connection
to the FM modulator, e.g., varicap. It uses a carefully selected
waveform to allow 9.6 Kbd in a 20 Khz bandwidth (including guard
bands). Some people have reported using G3RUH-type modems for 9.6 Kbd
in 15 Khz bandwidth with appropriate reduction in deviation. By the
way, the receive AF must be taken directly from the discriminator. In
other words, the modem is not designed to interface via the microphone
and speaker jacks of a typical radio.

4417. DSP Choices

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-29 00:43:53 UTC
From: smithson@rosharon.wireline.slb.com
Message-ID: <3bdtg9$dj5@sndsu1.sinet.slb.com>
Source record: 46209

If this is in a FAQ somewhere, flame me and tell me where to go find it
HI.

I am considering a DSP for my HF applications. There are now so many out
there I'm not sure which to go with. As I see it there is:

Timewave
W9GR II
Radio Shack
MFJ
Kits
(OK whom did I offfend by leaving out??)

Costs run from $150-$300+. Just curious if anyone has used some of the new
kids on the block and which has given the most pleasure. I have no pre-
conceptions so no convincing necessary.

Should tell my applications: Amtor/Pactor; SSB on 15, 40, and 75; possible
CW and RTTY (contest time). I use a PK-232 and rig is TS-850SAT. Antenna
may be only a dipole or 4 EL beam (5 bander.)

Your input will be appreciated.

Tony

Mike, since you're reading the mail, it must be the tone level. Without
a deviation meter, your best bet would be to ballpark it by first trying
to lower the level until something reads you ok. Perhaps a friend with a
packet setup. Then, once you're at least being read, if you can connect
into an X1J node with the deviation meter modification, you can type
mheard to see how you compare with others. You can also use a monitor or
spare transceiver to judge how your signal "sounds" compared with someone
else whose system is working.

Someone else who knows the equipment better might be able to determine if
you are, perhaps, not connected properly, but you should be able to know
that by listening to your signal on a scanner.

Oh yeah, also try increasing TXD to, say, 50 or so.

I have the PK-900 and the PK-232mbx (without mods). I hooked both
of them up to my FT-990, my laptop to one and the big computer to the
other. I found that the PK-990 performed quite a bit better on weak
rtty signals. I was unable to detect any difference on FEC modes of
amtor or pactor, but I didn't really copy enough weak signals to
make any definitive statements. Maybe I'll try it again and see.
I didn't spend a lot of time, just enough to reassure myself that
the money hadn't been wasted. It would be difficult to compare
the units in the ARQ mode, for obvious reasons, so I didn't try.

While I didn't compare the PK-900 to the TTL/2 or ST-5, I think
the old TU's are still superior on rtty. Maybe I'll give that
a try one of these days. (Now where did I put that supply of tubes
for the TTL/2?)

I understand there are mods that one can make to improve the pk-232 for
hf operation, but it renders the unit inoperable on vhf packet.

Operation of the PK-900 in simultaneous dual mode is not a pleasant
experience if you don't have specific software to handle the simultaneous
data. It can be done, but it would be nicer if you displayed each channel
on a different window/screen. I can't comment on the KAM. I've
used them, but never compared them to the AEA products.

73, y'all.

Jim.

Source record: 46215

You can do a lot by just listening. If you have an HT, tune it to your packet frequency and see what your signal sounds like compared to another. If you don't have one, call up another ham and have him listen to your signal. It will help if he(she) is also active on packet. If you don't know anyone, copy down one of the calls that you hear and get his name/address from a callbook or callbook CD or online callbook database and give him(her) a call. You can set it by ear if you are careful. I've done it.

Now, maybe you weren't able to connect for other reasons. Remember that the station that you are trying to connect to may not have heard you. There might have been another station transmitting at the same time that you couldn't hear and interferred with you.

73, Jim.

The USCG uses minimum shift keying with 25Hz of modulation which I think comes out to 50 baud.

From: feistjf@nisewest.nosc.mil
Message-ID: <1994Nov29.183830.1397@nosc.mil>
Source record: 45973

Greetings to ALL, I was wondering if the JNOS has the capability of addressing the dual ports of the Kantronics DE ?
I have used JNOS once before with G8BPQ as the port drivers. BPQ allows the differentation between Port A/B using a single async line. This works well with FBB.
Also, If I use the BPQ driver with JNOS, what is the maximum number of ports I can assign. Currently, with BPQ and FBB, I have 5 ports with 3 tncs working. Can JNOS fill these shoes?

Regards, 73, John F Feist

Baycom 1.6 is being sold in America only by PacComm. It is not
freeware or shareware, and should not appear on any FTP site.
In this country, to do so would violate copywrite laws. And,
by archiving it at a public site deprives the authors of some
much-deserved cash, which they could use to enhance future
developement efforts. -pat

I spoke to someone today who is working on the sound blaster as a TNC and
according to him, there is no problem with using it to receive but there
are some transmit problems. He has developed SW to use it for Slow Scan
TV (color and BW) but has not yet come to the next step (other digi modes.)
To his/my knowledge, no one has developed SW to do what you ask but there
is some work in progress.
Not much help FWIW.

>who do read my message, I was wondering if anyone has ever created a ham packet
>version of a token ring (preferably with 9600 bps and tcp/ip)?

What exactly do you mean? A token passing protocol would rule on
packet channels where hidden transmitters are common. However, the
problem with a token passing protocol is that changes in topology
need to be allowed. Furthermore, a token passing protocol may be
best suited for point-to-point linking of nodes.

Karn has published a paper on a form of token passing which he called
"MACA". I believe the paper is available from ftp.ucsd.edu. This protocol
doesn't actually pass a token, as I recall, but it uses a short token to
grab the channel. A strict token passing protocol requires a token to be
constantly passed around (i.e. some transmitter in the network is always
active), where Karn's proposal only requires the channel to be active when
it needs to be (this is all from memory and may be in error).

Now that I've said all this, I'll mention that everytime I've seen someone
post a note saying "Can I have Token Ring on packet?", they really haven't
had a clear idea of what they were asking for. Keep in mind, token ring,
as developed by IBM and standardized in the IEEE 802.x family, doesn't really
directly translate to the packet radio context. What exactly did you
really mean asking this question?

This posting brings to mind a company that sells AMI motherboards
with built-in mouse ports, similar to how the PS2 had a motherboard
mouse.

Washburn & Co. Distributors
3800 Monroe Avenue
Pittsford, New York 14534
716-248-3627 fax 716-381-7549

Just a satisfied customer...

Also Kensington sells a trackball mouse in two versions: serial, which
ties up a com port, or buss version, which comes with a card that
does not tie up a com port address. The card can be addressed to
INT 12, which is the usual interrupt for buss or motherboard mice.

4437. BAYCOM Terminal Version 1.7 a FAKE!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-30 05:12:59 UTC
From: ve4mjm@draco.bison.mb.ca
Message-ID: <3bh1kr$mui@draco.bison.mb.ca>
Source record: 46158

Yes it's true.

Apparently someone has hacked up version 1.4 or 1.5 and passed it off as
version 1.7.
The last official version of the BAYCOM Terminal Software is 1.6. The
BAYCOM programmers do not intend to release a version 1.7 in the future.

So if you find a version 1.7, it's a fake and should be discarded.

This is my interpretation of a packet message I received from someone in
Cal. If anyone wants confirmation of this, I will gladly post that
message to the net. I don't have it at my disposal at the moment.

I have a PK-900 and love it. It does have better filters than the Kam does.
You are getting something for your money. I very much like the large LCD
display and all of the information that it displays.

>A friend of mine has a PK-232MBX which I think is a
>fine unit, but it lacks simultaneous dual port operation.

As I am sure you are well aware the PK-900 is a dual port multi mode TNC. I
have been connected to the VHF DX node and been working HF pactor at the
same time. It really works!

>I have also
>considered the Kantronics KAM, but have heard that it does not perform as
>well as the PK-232MBX under poor HF conditions.

This is due to the better filters in the PK-900.

4439. Pseudo-Bayesian stabilization of Packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-30 06:47:27 UTC
From: tedwards@Glue.umd.edu
Message-ID: <3bh75v$p88@thrash.src.umd.edu>
Source record: 46231

In 1985, Ron Rivest came up with a way of stabilizing the Aloha protocol (which is closely related to AX.25) known as the "pseudo-bayesian" method.

If there are too many packets backlogged at all of your TNC's, then you know that everyone is trying to resend their backlogged packets too quickly. I forget what AX.25 defaults to, but I think it is something like exponential backoff, i.e. it decreases the chance Qr that it will resend a packet in a given time quantum every time it fails to correctly send it.

The "Pseudo-Bayesian" method makes an estimate of the number of backlogged packets by reducing Qr every time there is a collision... the important part here being that the collision does not have to be your TNC's collision, but detection of collision from another station as well.

Basically, every time quantum your TNC would see if there was a collision (either through it timing out on a packet, getting a bad checksum message back from the receiving node, or hearing any other node send a bad checksum message). If there was a collision, Qr would be reduced by the proper amount. If not (i.e. idle or successful packets transfered), it would increase Qr.

The real difference between this and AX.25 is monitoring the failures of other TNCs, and also going immediately into a mode where Qr is used as a chance to send a packet, instead of sending the packet right away the first time, then going into "backlog" mode.

I have to check the details of AX.25 to see if there is already a flag in the packets indicating how many times a packet has been resent. That is a good way to see if there are other TNCs having timeout problems as well as collisions detected by receiving nodes. If you see packets that have a flag indicating they are resends of timed-out packets, you can know that a collision has occurred. Infact, you don't really need a counter, just a one bit flag. The first time a packet goes out it is 0, the second time and thereafter (due to timeout or bad checksum) it is 1. Every time you see a packet sent with a "1" in the resend flag, you know another collision has occurred.

Of course, this simplification ignores the reality that no one packet station will be able to fully monitor the collisions of all nodes on frequency because of the "hidden node" problem, and also that not all retries are due to collisions.

But it would be interesting to see how this compares with vanilla AX.25. One of the big problems I encounter is that two powerful stations communicating with each other (say one NET-ROM node and one power-user) can deny service of other less powerful users, especially if they are sending long packets continuously.
With pseudo-bayesian, these nodes will start slowing down when they see the weaker nodes failing to communicate, lowering individual throughput to increase global throughput.

At the same time, PACSAT could be a win on the high seas. There won't be
anyone else in the footprint trying to talk to it.
You do need two radios and the appropriate TNC, but 25W
out and 1/4 wave antennas should allow you to use PACSAT OK
(you could make freakier antennas to reduce the overhead hole of
verticals, but keep in mind that PACSAT uploading and downloading
can be fairly automatic, and you can take a couple of passes to
get/grab your message).

I'm trying to put together a simple packet modem for VHF use, and I seem to have problem locating this IC locally:

TCM3105

It's a 'single chip FSK modem' and is manufacturered by Texas Instruments. It comes in a 16 pin DIL package if I'm not mistaken (TCM3105N)

Can someone let me know where I can find this part number, and how much should I expect to pay for it if I'm getting it in small quanitites (Perhaps 2-3 pieces?) ^^^

Thanks!

Yes, if it's a Bell 202, half duplex leased line computer modem. That
probably means it was made prior to 1980. You'll still have to do the
HDLC bit stuffing and AX25 protocol in software on your computer, and
rig some way to do PTT of the radio. Newer Smartmodems(tm) can't do
the tones used for amateur packet.

My brother (N7BPT) is single handing his 27' sailboat VIRTUE in the South Pacific and we stay in touch with packet via the N6QMY gateway to internet. He use an HF xcvr and KAM tnc.

Things works pretty well (and we both use Macs) except when N6QMY's routing tables include the satellite! Then packets seems to get swallowed up and never delivered to him.... I don't know what the real cause is but since I have no control over the routing, its frustrating to have the link 'go down' for weeks at a time!

Some form of BPSK related (or) to Bell 201A. Most are using the EXAR BPSK chip.

>
> I believe that they use some higher AFSK tone than on 1200bps.
> I heard about 3658/1996 Hz. Is't true ? Or maybe there no any
> standard yet...

The only work I am aware of with AFSK 2400bps, is some work done in Quebec Canada in 1980 using 2000-4000hz AFSK tones. There were fed into modified 220 mhz radios. This is not hard to do with TNC1/TNC2 and MFJ tnc's, all of which have tuneable modems in them.

>
> I'am try play with TCM3105 on 2400 (it work if S/N is good) and will
> set up true tone.

TCM3105 (bell 202) only has 1000hz shift so won't work on 2400bps. I've been able to get 1800bps out of bell 202 modems, but starts to fall apart at that point. You'll need at least 1200hz shift to even attempt to do 2400bps AFSK.

4453. AEA DSP1232 /2232 software

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-11-30 19:59:42 UTC
From: gwod@rye.az.stratus.com
Message-ID: <3biljf$15l@transfer.stratus.com>
Source record: 46145

Greetings:

I own a DSP 1232 multimode TNC from AEA. Does anyone know of 3rd party or non-AEA developed software for this unit? I am particularly interested in software for commercial/military digital modes, wefax, and SSTV reception.

I have AEA's Packrat for Windows and I understand that AEA introduced a wefax package. The DSP unit has the capability to do a lot but there is limited amateur and non-amateur software for it.

I spoke to AEA a few times and was suprised to find that the new wefax program is expensive and does not integrate to Packrat for Windows in any way.

Has anyone had any experiences with the DSP 1232 or DSP 2232?

Any valid suggestions are welcome.

Token ring in the 802.5 sense does provide for topology changes. They
are not necessarily pretty, but it works. (Beaconing). Some similar
type of thing could be conceived of for packet radio.

>
>Karn has published a paper on a form of token passing which he called

Actually, having all the stations transmitting in sequence, even when they
have no data to send is an interesting idea. It certainly would let others
thinking about using a given frequency that the frequency was otherwise
occupied. Given the lack of coordination for non-repeaters in some parts
of the country, this could be useful.

If truly token passing, it would be essential to have all stations keep
transmitting, especially if not all stations can hear one another. All
packet data also would have to be passed from one station to the next.

>
>Now that I've said all this, I'll mention that everytime I've seen someone

I think the topology would be closer to 802.4 token bus, but without the ability of all stations to hear one another, as is usually the case.

Dan

>Dave

I totally disagree. The condition you referred to with a busy channel
is a factor of the parameters you set for your TNC (slottime, etc.) and
the traffic load on the network. If you'd set it to do so, it would
gladly have walked over other people, etc.

There is NEVER a case where a "fast enough" CPU is any worse solution
than a CPU and specialized HDLC hardware, UART hardware or whatever.
As long as there is enough compute power, the job can get done.

Do you still own a KAM? Does it still have this problem? Mine does not.
Perhaps they fixed the issue in software (bugs happen). Bugs also happen
in HDLC chips and other pieces of hardware. The software bugs are a lot
easier to fix.

I've contested with both the KAM Plus and with the PK232MBX. They do about
as well as each other, and I personally like using the KAM. If you look at
the RTTY roundup results for the last two years, you'll see that I got
4th in the USA, low power multi, in both years. Last year I used a KAM+,
the year before I used a PK232MBX. (next year I may try a HAL ST8000).

Dan

Certainly 802.5 provides for topology changes. However, the algorithm for
a half-duplex radio environment would have to be considerably different.

>>Karn has published a paper on a form of token passing which he called

>occupied. Given the lack of coordination for non-repeaters in some parts
>of the country, this could be useful.

Well, what is the real advantage of building a protocol which acts like
real token ring, constantly passing a token around? In the case of an
802.5 network, failures in the ring are rapidly detected, and, if possible,
corrected (this is the top change issue again). In an RF network, the
failure of a node would be caught this way, but not the addition of a node.
Furthermore, constantly passing the token around is probably going to increase
the chance of dropping the token, even when no one needs it. A dropped token
causes the topology change algorithm to begin, which is probably quite a bit
more costly for an RF network than an 802.5 ring. So, things that are benefits

for an 802.5 ring are either of little value to an RF network or likely to be too costly.

Anyway, an RF environment is likely to have unequal and variable connectivity, which an 802.5 ring doesn't. Having an RF topology pass a token out somewhere where there is no hidden transmitter problem is inefficient. Also, the latency issue with token ring would be made worse, I think.

The idea that constantly passing a token keeps a frequency busy so others will be discouraged from using the frequency strikes me as wrong. Given the shared nature of amateur allocations and the FCC desire for maximal utilization of frequencies in general, a technology which keeps an otherwise idle channel unusable by anyone is not a good goal.

>If truly token passing, it would be essential to have all stations keep
>transmitting, especially if not all stations can hear one another. All
>packet data also would have to be passed from one station to the next.

Yup, all the way around the ring. Ugh.

>I think the topology would be closer to 802.4 token bus, but without the
>ability of all stations to hear one another, as is usually the case.

The fact that not all stations can hear each other should be exploited; nodes which don't impact each other should be able to have contention-free exchanges whenever possible and wait otherwise.

I believe that there are some patches for BorlandC 4.0 residing at ftp.ucsd.edu
in the usual hamradio/packet/tcpip/incoming. These are for use with JNOS

I had quite a lot of flaky executables from BorlandC 3.0, whilst version
3.1 seems to produce a very stable JNOS 1.10g. I hear that WNOS
is designed with version 2.0 in mind.

Cheers,
Gareth.

At W3EAX (University of Marylanda ARA), we've used our DSP 1232 for all
kinds of things, copying AO-13 telemetry, PACSAT, 2400 bps packet, etc.

One of the things "promised" to come was a PACSAT modem that automatically
triggered up/down tuning of the receiving radio. Has this been implemented?
Is it free, or how much is it? Following the downlink by hand is really
annoying.

Has anyone tried using the special meteor scatter mode?

I have both a KAM and a KPC-3. I love the KPC-3. Small, lightweight and
works on a 9v battery. The documentation is excellent. i learned more
about using my KAM from the KPC-3 docs than with the KAM docs. One
sugestion. Kantronics tells you to solder a 9v battery connector to two
pads on the PC board for battery operation. Instead solder the 9v battery
connector to a power plug to fit in the external power connection. It is
much easied to change the battery and less likely to accedently run the
battery down.

I have uploaded to SimTel, the Coast to Coast Software Repository (tm),
(available by anonymous ftp from the primary mirror site OAK.Oakland.Edu
and its mirrors):

SimTel/msdos/packet/
mlhack25.zip Zenith Minisport docs, hints, hacks & goodies

MLHACK25.ZIP is a compendium of newsletters about the Zenith Minisport
laptop computer and its use as a packet radio host computer. Zenith
offers only minimal and expensive support for this popular but
discontinued 8086 compatible notebook computer. Newsletters contain
technical notes, construction projects, operating hints, resources,
architecture details and other related goodies. The Minisport Laptop
Hacker (TM) series is the result of owning and repairing Minisports and
donations from others on Internet and the Amateur Radio packet networks.

Special requirements: None

Changes: Compendium includes Minisport Laptop Hacker #1 - #25.

mlhack25.zip has replaced mlhacker.zip.

Good program, but wait for an upload of APRS62a which is a bug fix
version. The bug concerns a rain alarm in the new version. The new 62a
version is supposed to be available as of 11/28/94.

Also, I had packet mail to WB4APR returned as undeliverable to that
packet BBS Tim listed. I resent it this evening.

From: Rolla@ICO.OLIVETTI.COM
Message-ID: <Rolla.3.0@ICO.OLIVETTI.COM>
Source record: 46156

Hallo,
Yesterday I had a problem:
After many months of succesful running of FBB5.15c I changed my
memory manager to QEMM v.7.
The advantages of using this memory manager are cospicous, but now
when I start FBB, after loading the messages base, I get an error message
in a pop-up that says that there is an error on drive D: (My DOS 6.00
compressed drive where FBB is). After this I get the classical message
from QEMM saying that an internal error occurred in the application..etc,etc.
I know that many errors of this kind are possibles if there is a memory
conflict, but why I get the error on drive D:?
It is maybe another gift from the Microsoft's Doubledisk ? ;)
Any ideas about solving this problem ??
Many thanks anticipately.

>melbourne australia

Hello evertybody,
BayCom Version 1.6 is COPYRIGHTed to the BayCom-Team and not
longer any kind of Public Domain-, Shareware, Freeware ....
It is avaible ONLY from BayCom in Germany or it's Distibution-dealers

You are not allowed to put BayCom Version 1.6 in any kind of
Mailboxes or FTP-sites.

So please be patience otherwise You will get trouble with the
BayCom-Team

4467. new Amicom version uploaded to aminet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-01 12:22:01 UTC
From: kittler@uni2a.unige.ch
Message-ID: <1994Dec1.142201.1@ugun2a>
Source record: 46102

Hello all Amiga ham radio operators,

I've just uploaded Amicom version 2.1a to the Aminet. It is in the misc/sci directory. ftp sites are numerous and available all over the world, so please choose the one closest to you. To get a list of these mirror sites, ftp to wuarchive.wustl.edu and get the list in the pub/aminet directory.

Amicom is a packet radio program which allows multi-connects, use of a BayCom modem (standard PC version), all kinds of TNCs and is user friendly.

It is really worth a look at!

Best 73s de Daniel

PS: please send any mails to hb9vbc@pccr01.cern.ch and not to this account! Thank you

4468. TCP/IP via Net/ROM nodes?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-01 14:38:39 UTC
From: aswNS@hamp.hampshire.edu
Message-ID: <3bkn5f$eai@gort.oit.umass.edu>
Source record: 46159

Ian Wade's NOSIntro book mentions that Net/ROM nodes of verison X1G and later can act as TCP/IP routers, but I am unable to figure out how to take advantage of this. The sysop of a local node (TheNet X1J) I wish to use forwarded to me a list of parameters to include in my autoexec.nos, and he has put my call and IP number in the node's database, so it appears in the IProute list, but I have been unable to connect to the node with TCP/IP, even though I have no problem making an ax25 connection to the same node.

I have quite a bit of experience using TCP/IP on NOS to NOS direct links and via a TCP/IP repeater, so I am pretty sure there are no problems in my autoexec.nos or other setup files.

I am using PA0GRI NOS, the Nov 1991 version. Is this version possibly lacking some feature I need to take advantage of NetROM IP routing?

4471. aprs62a.zip - Hams: Automatic Packet Reporting System (APRS)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-01 17:25:06 UTC
From: TPDugan@DOCKMASTER.NCSC.MIL
Message-ID: <9412011725.kp17732@SimTel.Coast.NET>
Source record: 46173
Cross-posted to: comp.archives.msdos.announce,rec.radio.amateur.digital.misc,rec.radio.amateur.misc

I have uploaded to SimTel, the Coast to Coast Software Repository (tm),
(available by anonymous ftp from the primary mirror site OAK.Oakland.Edu
and its mirrors):

SimTel/msdos/packet/
aprs62a.zip Hams: Automatic Packet Reporting System (APRS)

APRS can be summed up with two concepts, REAL-TIME PACKET TACTICAL
COMMUNICATIONS and MAPS. Probably 98% of APRS potential does not need
GPS or any tracking devices. Think of APRS as just a multi-user
distributed packet network with a MAP display for many exciting amateur
applications:

Network topology monitoring Direction Finding
weather reporting DX cluster monitoring
AMSAT ground station tracker Satellite tracker (future)
boat/mobile/RV tracker Special event tracker/organizer
Local area CHAT mode HF DX plotter
RF path estimating Search and Rescue
Frequency Coordination database

APRS nets are springing up nation wide on the experimental two-meter
frequency of 145.79 MHz and on the HF frequency of 10.1515 LSB for
vehicle tracking and SKYwarn applications,

aprs62a.zip is the latest version (as of 28 November 94) of APRS, and
contains all files. It replaces all previous versions and fixes a bug
in aprs62 that prevented turning off weather alarms.

The 12/93 firmware release does tune the radio through a pair of
pulsed outputs. I havn't hooked this up on the dsp2232, because I'm
using a dsp-12 at the moment for that function. However, there are
several folks who are using it successfully.

From: "Steven V. Christensen" <chrissv@cat.com>
Message-ID: <3bl96p$56e@agate.berkeley.edu>
Source record: 46163

Greetings,

Last week I got a flyer from AEA showcasing their new
products. They mentioned that the PK-88 will not be sold any
more, in favor of a new PK-12 (the number may be wrong). The
PCB-88 (again unsure on the number) - the internal PC card
TNC - will still be sold and supported.

It would be nice if AEA released the source code to
the EPROM in the PK-88 (since they aren't going to do any more
upgrades). Wishfull thinking?

Steven

I think you may be confused as to concepts. As far as I know (and
please correct me if I'm wrong, someone) TheNet nodes won't accept actual
connects to the node interface (i.e. telnet connects) via TCP/IP, they
will only act as TCP/IP routers, accepting TCP/IP packets from stations and
routing them on to the appropriate routers or end nodes.

You can connect to Net/ROM nodes via the netrom code in NOS, but that
doesn't involve using TCP/IP at all, only Net/ROM protocols. You can also
route TCP/IP traffic through a Net/ROM node by encapsulating it in Net/ROM
packets and forwarding it through the network to NOS stations that are
set up to be Net/ROM nodes themselves. This is designed to allow creation
of wide-area TCP/IP networks using the existing Net/ROM network as the
long-haul transport.

>
> Some form of BPSK related (or) to Bell 201A. Most are using the EXAR BPSK chip.

Yes, BPSK. My MFJ-1278T uses the eXar 2123 modem chip. I don't have
a suitable eXar databook handy, so I can't tell details, but the 2123
is a BPSK chip.

Hi,

I would like to get into hf packet, but I can't set my call properly.
Until I get the paper in my hand (or dec 20), I need to add "/AA" to my
call on hf. My PK232 will not allow me to set mycall to a call ending
in "/AA". Is there any to get around it?

Do I need the "/AA" for packet or only for voice and cw?

Will an MFJ tnc (tapr 2 clone) work? (I have one I am using for VHF).

Thanks and 73,

Geoff.

Help Needed on DEC Rd-53 RD-54 Disk Drives

Hi name here is Rob and I have a (2) small problems. I was fortunate
enough (I think) to get 2 disk drives from a Digital Micro-VAX II
that was being scrapped. The big problem is knowing what to do
with them (hi). They are a RD-53 and RD-54.

The RD-53 is a Micropolis Model #: 1325 (71.3 Megabytes)

The RD-54 is a MAXTOR Model#: XT-2190 (190 Megabytes)

Well the problem is what type of PC controller (MFM,IDE..etc)
controller will work if any and what special things must
I do to get these drives IBM compatible

I think one of them was stamped as a RQDX series. Any and all
info would be greatly appreciated...

73 es tnx in advance..

Rob

From: aswNS@hamp.hampshire.edu
Message-ID: <3bmaqu$a8p@gort.oit.umass.edu>
Source record: 46180

I have a KAM Plus, purchased 2nd hand, but less than a year old. It frequently loses its stored parameters and comes up in the mode where it starts searching for the baud rate. Has anyone else experienced this, and is there a fix?

This frequently happens when I have been operating tcp/ip in KISS mode and then want to start using ordinary ax.25 again. But that may be just a coincidence. These failures don't seem to be related to how long it has been since the last time I used it. Sometimes the parameters are good when the unit has been off for a month, other times they erase themselves overnight.

The schematic shows a battery, but it isn't mentioned in the manual (or at least not in the index to the manual). Does anyone know the specs on this battery or how long it ought to last?

Message-ID: <3bmcr4$mho@agate.berkeley.edu>
Source record: 46181

Greetings,

I am a user of an FBB BBS system, and lately I don't have
time to log on and "L"ist all new messages since the last time I
log on. So I log on and list only topics I want to see.

What I want to do is then reset the "last message seen"
number that FBB reports when I log on, without having to do a "L"
and see every message since the last time I logged on.

Does anyone know how I can reset this number without listing
all messages?

Thanks and 73,

Steven

NASA voorlopig niet naar Pluto. Het had zo mooi kunnen zijn, twee
------------------------------ kleine ruimte vaartuigjes die in
2001 gelanceerd worden en die in 2008 een vlucht langs de buitenste
planeet Pluto maken. Met het PFF-project (Pluto Fast Flyby) zou de
NASA de eerste verkenningsronde van het zonnestelsel hebben voltooid
```

elke planeet zou dan van nabij zijn onderzocht. Maar de plannen gaan voorlopig niet door. NASA topman Daniel Goldin vindt het project te duur. Goldin lanceerde enkele jaren geleden zijn faster, cheaper, better adagium, NASA zou zich niet langer moeten richten op grote, peperdure projecten, maar kleine, relatief goedkope ruimtesonde's moeten bouwen. Hoewel het PFF project niet echt goedkoop is (580 miljoen dollar, inclusief de lancering met een Russische Proton raket), was Goldin jarenlang een fervent voorstander van het project Daar is nu dus verandering in gekomen. Het PFF project mag van Goldin niet meer dan 250 miljoen dollar kosten,zo vertelde hij begin november op een bijeenkomst van de Division for Planetary Science van de American Astronomical Society. Zo'n ingrijpende bezuiniging lijkt onhaalbaar, zelfs wanneer besloten zou worden om maar een ruimtesonde te lanceren. Er is de planeetonderzoekers alles aan ge-legen om zo snel mogelijk naar Pluto te gaan. De kleine, verre planeet bevindt zich nu in een deel van zijn baan dat wat dichter bij de zon ligt dan gemiddeld. Daardoor is het methaanijs op het oppervlak gedeeltelijk verdampt, en heeft Pluto zich in een zeer ijle dampkring gehuld,die door een passerende ruimtesonde onderzocht kan worden. Na 2010 is de afstand tot de zon weer zo groot geworden dat de dampkring verdwenen zal zijn..... Bron.: Science Today.

++ PA3ESF + THE WORLD LINK RTTY BULLETIN + URETERP + R14 + JO33CC ++

SATELLIETEN (NOAA-2). De opname scherpte wordt bepaald door het zo-
---------- genaamde scheidend vermogen wat aangeeft hoe groot voorwerpen dienen te zijn om nog van elkaar te kunnen worden onderscheiden.Met de NOAA satellieten worden dan ook opnamen gemaakt met een verschillend 'scheidend vermogen'. Dit verschil bereikt men door de aftast spiegel sneller te laten draaien (voor APT opnamen 48x p/m). Het scheidend vermogen is voor zichtbaar licht 3,9 KM en voor infra-rood opnamen 7,8 KM. Om een nog groter onderscheidend vermogen te verkrijgen maakt men gebruik van VHRR opnamen (Very High Resolution Radiometer) waarbij het spiegeltje 400x p/m draait en zo de afgetaste stroken op aarde, smaller en dichter tegen elkaar komen te liggen. Zo bereikt men een zichtbaar vermogen van 0.87 KM bij beide opname (licht) technieken. Deze VHRR opnames geven bijzonder scherpe en heldere beelden van het aardoppervlak of bewolkingen. Een opvolger van de NOAA sateliet werd in 1978 de TIROS-N die op 830 KM hoogte zijn baanvlak en evenals de NOAA satellieten ook onderzoek verrichtte aan de sondering van temperatuur profielen in vakken van slechts 22 vierkante KM terwijl de NOAA satelliet ook onderzoek verichtte naar vertikale temperatuur profielen in een vlak van 59 vierkante KM. Tot zover de NOAA satelliet.
..... wordt vervolgd. bron .: PA3BKW.

Misbruik 2M frequenties. Hallo allemaal, het blijkt nog steeds, dat
---------- er mensen zijn, die nog steeds niet (willen) weten, dat het frequentie-gedeelte tussen 144.845 en 144.990 MHz EXCLUSIEF voor bakens is en dat het gebied 145.800 tot 146.000 EXCLUSIEF voor satelliet-verkeer bedoeld is.

AZOREN. Het aeronautical fixed station (AFS) van het vliegveld
------- Santa Maria is 24 uur per dag met 50 baud radioteletype-
uitzendingen in de lucht. De frequentie is 14497.5 kHz en de roep
letters zijn CSY.

EGYPTE. Het persbureau Middle East News Agency (MENA) uit Cairo
------- heeft eind oktober drie satelliet-kanalen in gebruik ge-
nomen. Door middel van een Eutelsat- en twee Intelsat-transponders
is MENA niet langer afhankelijk van de kortegolf. Op dit moment zijn
de HF-radioteletype uitzendingen te horen en te lezen op ondermeer
15935 kHz.

GUAM. De Adventist World Radio-zender KSDA bij Facpi Point kan
----- tussen 15.00 en 17.00 uur UTC met een Engelstalige uitzending
worden gehoord op 9370 kHz. De signaalsterkte is nogal wisselend.
Volgens een nieuwsbrief van AWR, is men van plan om volgend jaar een
nieuwe kortegolfzender in Paraguay op te richten.

NEDERLAND. Radio Nederland Wereldomroep kondigt een nieuw internet-
---------- adres aan. Het station is binnenkort te bereiken via,
letters@rnw.nl (Bron: Media Network/Radio Nederland Wereldomroep)

PARAGUAY. Radio Nacional uit de hoofdstad Asuncion is weer met
--------- goede signalen in ons land gehoord. Wian Stienstra uit
Groningen rapporteert het station rond 01.00 uur UTC op 9735 kHz.

RUSLAND. Als gevolg van een door president Jeltsin uitgevaardigd
-------- decreet gaat de wereldomroep van Radio Moskou sinds 1
november als Voice of Russia World Service door het leven. De uit-
zendingen gericht op Burma, Thailand, Laos en de Filipijnen zijn in
de recente bezuinigingsdrift ten onder gegaan. (Diverse bronnen)

TAIWAN. Het semi-clandestiene station Voice of China zendt tweemaal
------- per dag uit via het zenderpark van Taiwan's Central Broad-
casting System (CBS). De op de volksrepubliek gerichte Chinese
propaganda-uitzendingen komen tussen 08.30 en 09.30 uur UTC in de
lucht op 11940 kHz. Van 21.00 tot 22.00 uur UTC is het station
actief op0 15280 kHz. Onlangs kwam de band tussen CBS en de Voice of
China nog eens aan de oppervlakte, toen de ochtenduitzending abusie-
velijk op de CBS-frequentie 9690 kHz werd geschakeld. (Bron: Summary

HI Al, I have a KPC-9612 that I run in KISS with JNOS and it sometimes returns to standard mode with different parameters. I think it's because the JNOS program changes them from the set up files in the program. I don't think it's a problem with the memory or the battery but on a similar note, i have noticed that sometimes the TNC reverts to default and waits for the autobaud routine when I turn it off or there's a power failure. I am operating two stations with the KPC-9612 and it happens to both but another HAM has one and runs it in HOST mode without any trouble this way. There could be something to the backup battery when in KISS but it's certainly strange when it goes back to default. I believe the batteries are good for 3 to 5 years in the meantime. I've checked both of mine and they're fine, charge wise.

I run an FBB BBS and have used many of them. I am not totally sure what
you want but I'll say this. When you pick topics, with the LC command, it
will set your last message read flag to the last message on the board at
the time of disconnect, regardless which category you are viewing. If you
are only interested in certain categories, you would have to view them
all in one connect or the BBS would assume that you had anyway and set
your LMR number accordingly. If you subsequently connect to view another
categoryu, you won't see any bulletins before the LMR, unless you use the
LL command.

If this is not what you wanted to know, please disregard HI.

>`
The Arrl Spread spectrum Source Book is the typical coppendeum of articles. It will get you started and has a lot of good references. If you are looking for a SS how to book you are kind of out of luck. It is still pretty experimental and you must hold a general class license to experiment with it.

When you do a list use the command "l nnnn-" where nnnn is the number of the last message you listed. This is supposed to be automatic but often is not. Subject filters will still apply as that is a different command. 73 de Jerry packet address in signature.

Greetings,

Just to clear up a few things: Please note that not all sound cards are equal - "Soundblaster" is a trademark of Creative Labs, however there are many other manufacturers making fine sound cards that are "Soundblaster" compatible. Some of these contain DSP chips, not all of which are easy to use for "other" applications - the reason being mainly the lack of technical details and support from manufacturers.

There was an earlier post regarding the use of a sound card for doing packet by Tom Sailer, HB9JNX. He has developed innovative software for 1200/9600 baud packet modems that uses the on-board DSP chip of a Cardinal PRO 16

sound card (card only costs $80). In Tom's software, the DSP does
the packet modem in DSP on the sound card, thus relieving the PC from this
computational loading. The PC, however, still does play an active part in
routing data between the modem and the radio.

I also have developed DSP software for this type of sound card, i.e. AMTOR,
Pactor, and a port of well-known W9GR noise processor. This code is
available (free) for anonymous ftp downloading from:

ftp.UCSD.edu /pub/hamradio/packet/tcpip/incoming

-look for:

PSATORxx.ZIP ----- AMTOR/PACTOR
DSPSNDx.ZIP ----- W9GR port noise processor. (x means the latest version)
Some of this is also available on ftp.cs.buffalo.edu in /pub/ham-radio.

The reason why this is possible with the Cardinal-type sound cards, is
that programming specifics for the DSP chip set are available, whereas for
the Creative labs' "Soundblaster" boards, this is a closely guarded secret.

Hope this helps - for those further interested, also check the August 1994
and November 1994 QEX for ham radio projects based on DSP-based sound cards.

I am sure, however, others have made some progress using "Sound blaster"
cards - please keep us posted on progress. There are a lot of interest in
this type of developement.

4498. FBB problem - 3 TNCs?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-02 17:23:36 UTC
From: russell@spdcc.com
Message-ID: <D071nC.1HK@spdcc.com>
Source record: 46186

I've been working with the sysop of a local FBB system, trying to add a third TNC. He currently has two hooked up fine and running. When the system comes up, it takes just a second to initialize the two and comes up properly.

However, when we add the configuration for the third port (which is on COM3, IRQ 5, tested), the system comes up and starts initializing the first TNC in a different way, with some sort of a counter, and it gives up before it even finishes that first one. The initialization portion looks completely different than it does with just the two hooked up.

All three TNCs are PK-88s, and when I hook the third one up as one of the initial two and start things up with two TNCs, it works fine, so I don't think it's a config problem with the new TNC.

Any ideas? I've RTFM, and didn't see anything that looked helpful.
I'd much appreciate any help!

4502. DSP for power line noise reduction

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-03 02:42:55 UTC
From: bart@wb6hqk.ampr.org
Message-ID: <D07rJK.Lu8@wb6hqk.ampr.org>
Source record: 45995

After many years of school and apartment living i'm finally in a house and starting to become active on HF once again. Over the next few months I plan to add some more antennas, purchase a new HF Rig and catch up where I left off 15 years or so ago. My biggest problem so far is dealing with various noise sources on the 80 and 40 meter bands. There are at least three distinct noise sources causing trouble at various times during the day. They typically are S7 with the SSB filter and occupy about 50 kHz at any given time. I have identified one as a switching power supply operating at a switching frequency at around 340 kHz but can't locate it's physical location. I'm wondering how well, if at all, the new DSP based audio filters can deal with this sort of periodic interference.

Anyone out there have any experience?

Thanks,

bart wb6hqk

Well, without writing some external s/w to bolt onto the BBS (which I
keep threatening to do, since some of my users are bothered by this),
the only way is to kludge it.

What you do is log-on, set your paging to say a couple of lines, do a
list, abort the listing, reset your paging and then do what you want and
disconnect. This can be easily achieved with a little script at your
end after logging on :-

OP 2
LR
A
A
OP (whatever it was)

do your own stuff and then exit with a B. Note, if you don't exit with a
B, then your list pointer will not be updated.

Cheers, Martin.

(whoops, I can't quote the original message)...

Are you sure that a General class license is needed to experiment with spread spectrum modulation techniques? From my reading of the rules, it appears that a technician can use all amateur UHF frequencies and no mention was made of SS restrictions.

Mark

Did you try to at least ping it? Since it's a router, I don't think you'll be able to connect to it directly. Try connecting to yourself via the router, maybe that will work. I worked with X1J TCP routing last winter and it seems to me that it worked as a straight router. As long as it knows where what is going it will forward it, but all the paths must be entered in the IProute table before you can go anywhere.

good luck, dino

I tell my users of this easy way. When you connect and want to clear
your LIST, do:
lc sex
l
lc *

This changes your TO field list control to SEX, lists all messages to
SEX (normally none), and then changes back to wildcard. Log off and
relog and you will find you are fully reset. It does NOT work to do
an L and then disconnect, like it used to several years ago.

Dino.... you can only route through X-1J nodes, you cannot connect to them. Make sure he has
setup the iproutes and an arp table for the local lan. Then try to ping it. I can send you examples by
mail, if you/he needs them.

I haven't looked at the regs to find out, but I will be surprised if I find
that SS experiments on 10GHz need general class or better. I would think
this is exactly the kind of thing the no-code tech license was supposed
to be for. GL and 73 Gerry K8EF@W8CQK.OH.USA.NA

Huh? Where'd you get the idea you need a General Class license to use
SS? SS is legal *only* in the Tech spectrum, and nowhere in the rules do I
see a restriction against Techs using any mode legal in their spectrum.

1.10h (941201)

- FBB batched forwarding added (by KF5MG). Enabled if FBBFWD is #defined
in config.h. THIS IS A PRELIMINARY VERSION ... more to come later.

- XP setting remembered and restored at subsequent connects (by DL1BJL).

- MBOX RESET <callsign> command added (by N2RJT). Forces a disconnect
from the mailbox of the indicated callsign.

- Xpert-mode prompt now contains current message number.

- Color tracing enabled via -gN command-line option. N=0 is the
default, and N=1 is for grey-scale monitors, and N=2 for color monitors.
N=1 or 2 assumes ANSI.SYS was loaded. By PE1DGZ.

- AX.25 users can be prompted for login name and password, if AX25PASSWORD
is defined in config.h. (KF5MG)

- More files added to CMDSHELP.ZIP. Some files updated, too.

- Protocol-specific permissions name checked in ftpusers (and is used instead
of univperm): (N2RJT)
tcpperm - telnet login to mailbox
ax25perm - ax.25 login to mailbox
nrperm - netrom login to mailbox
confperm - convers signin
pppperm - PPP's call to userlogin
ftpperm - ftp login

tipperm - tip login to mailbox

- Sessions can be toggled between single and split screen, by using the "session N split on|off" command (N2RJT).

- Status line counters extended to include SMTP, NNTP and POP sessions, and are not displayed when zero (KD1SM).

- A asy interface may now have bpq-style checksums added and checked on KISS packets if the interface was attached with the attach flag "c". The format of the attach command is:
attach asy <ioaddr> <irq> ax25 <label> <bufsize> <mtu> <speed> c
Submitted by OH2BNS.

- The packet ID used for encapsulated packets can be changed from the default 94, to 4, by the "IP ENCAP 4" command.

- Jnos will now remove NNTP locks at startup (unless -l was given on the command line).

- SMTP messages which are subsequently forwarded as bulletins, will have unique BIDS assigned based on their entire Message-Id, thus eliminating spurious DUPE BID rejects. From KF5MG.

- SLIP/PPP problems with invalid frees at detach or Jnos exit, have been fixed.

- Multiple entries for the same BBS in the forward.bbs file is now OK, provided each entry is for a different time range.

- Many miscellaneous fixes, and small enhancements.

Bob Nielsen, W6SWE

Gidday

I saw a comment here some time ago regarding running 2400BPS on a TCM3105.

Has anyone done this successfully and if so what does the modem circuit looks like.

I also wonder whether the computer would keep up with this modem if it was being run in "Baycom" mode. (using RTS DTR on a serial port etc and not a TNC)

Try ftp.ucsd.edu in /hamradio/packet/tcpip/mac and look for NetMac which is an implementation of KA9Q's software for the Mac. Also IMMac, a mailer program. Later versions are in /hamradio/packet/tcpip/incoming.

A funny thing I noticed when running the older NET program (it doesn't happen
with NOS) -- pinging an X1G node doesn't appear to get a response. Monitoring
shows an error when the response is received, however. It works with X1J and
I think H.

4518. Pacterm on IBM PS/2

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-04 02:17:26 UTC
From: Bryan P King <kingbp@delphi.com>
Message-ID: <Z4wUewG.kingbp@delphi.com>
Source record: 46108

I have been having some difficulty using Kantronics Pacterm program with a KPC-3 on an IBM PS/2 Model 60. I have been running this from DOS, not shelling out to DOS from windows. The serial port connection from the KPC-3 is on COM2 and the mouse is on COM1. Both have their own IRQ's which are unique but share the same physical serial connection to the system through a Y cable. When I download information to buffer or print when connected to a station on packet, it will hang the pc. The error message I get at the bottom of the screen is: "INTERNAL STACK OVERFLOW" "SYSTEM HALTED"

The same program runs fine on a DECpc 333sx LP from either windows or DOS.

The baud rate has been dropped for the COM port on the IBM to 9600 baud.

When I use Windows Terminal to connect to the TNC at 9600 baud, I have no problems at all.

Thanks,

Bryan

Check your TCP/IP software and what commands are being sent to the TNC when you exit KISS mode. My guess is that it's doing a reset when you exit KISS.

Steven...

Get TPK v1.82...

TPK works with FBB and just gets the headers of all the messages...
Then you can scroll through at your leasure and mark all you wantto read...
It's totally automatic...

>starter?

The PK-88 is a fine tnc. I've had one for about three years now. If you
want basic vhf packet, it's a good way to go. Connection is easy to most
vhf rigs. Make sure you get the user manual with the tnc.

4522. RTTY, Hamcom, and stuff

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-04 17:23:06 UTC
From: dennisg@microware.com
Message-ID: <3bsttq$gtr@mcrware.microware.com>
Source record: 46115

Hi Everybody,

I am trying out the Hamcomm 3.0 software how it works, and what life on RTTY, etc. is like. I built the LM741 based interface (full blown) and it does receive ok, my question on xmitting.

I "think" that my signal is being modulated o.k. I have scoped the input to my mike circuit and it is appx 30mV which is o.k. for the data in on my FT-890. The signal looks like a sine wave with no clipping or distortion. I have no receiver to monitor my AFSK sig with, but my stereo RFI sounds like RTTY :-)

The problem is, I sit and call CQ all day long and get no replies. This of course makes me paranoid. I don't know if I am putting out a decodable signal or exactly what is happening. I a complete neophyte in RTTY so any suggestions will be appreciated. Is there some sort of standard center frequency I should use? One problem I do have is my CW filter is 250hz so when I receive I have to set Hamcomm's center freq real low (~500Hz) because either the high or low tone roll off quickly. It does receive fine though. Because of this I am xmitting with a ~500 Hz center tone.

I have read Steve Fords book cover to cover and got some ideas from it but noone wants to talk to me :-(Of course that might be by design?

4524. Where do I start (with packet and TCP/IP)?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-04 20:10:07 UTC
From: negaard@draagen.graceland.edu
Message-ID: <NEGAARD.94Dec4141007@draagen.graceland.edu>
Source record: 46117

Well, the subject tells the story; I'm waiting on my tech license, and
am interested in doing some advance prep for getting involved with
packet, and eventually TCP/IP, on the cheap.

I help administer a unix system at Graceland College, and I'm planning
on being involved in both the Graceland College Ham Club and the
Lamoni (Iowa) Amateur Radio Association (or whatever it's called). I
work for the department at the college which is responsible for our
Internet connection there, and my boss (who got me into amateur radio)
is the main decision-maker with regard to network issues.

Once I know a bit more, I may propose that the college club work with
my department to establish a packet gateway to the internet. The
college club already operates a digipeater. The thing is, I need a
resource or set of resources that will take me from where I am (lots
of general technical knowledge, but little in the way of specifics),
to a point where I can tell people what such a gateway would entail.
So, where do I start?

Thanks.

Two suggestions: "Guide to Facsimile Stations," by J. Klingenfuss, and "The Weather Radio Handbook," by Dr. Ralph Taggart.

Both are available from most of the major radio stores; the Taggart book can also be ordered direct from the ARRL.

Maybe someone can help me with a problem. I have a Yeasu FT 1000, a AEA PK-900, and an MFJ DSP filter. I want to use the combination on RTTY and HF Packet. MFJ does not answer my fax when I questioned them about cable connections. I want to use the Packet Din jack on the FT 1000. It is an AFSK input/output jack. The MFJ DSP filter has a filter for RTTY and Packet but I can't seem to get it right.

Has anyone successfully hooked up the combination? I would like a wiring diagram so I can make the cables.

> per@cchem.berkeley.edu

The two types really are just incomplete cables versus complete cables...
A basic cable just needs a few lines from one end to the other. A
hardware handshaking cable (like that needed for the Kantronics Hostmaster
for Macintosh for example) needs a few extra lines, so it can control the
flow of data by pulling up the voltage on a couple lines.... So it really
comes down to whether you bought a good cable or a cheap cable...

I'm looking for some high speed (56Kbps or greater) modems. Is the GRAPES 56K modem still available? Are other high speed modems available?

Has anyone done any kind of work with Ethernet stuff, now that those cards are so cheap?

Thanks,
Paul

4532. Re: AEA DSP1232 /2232 software

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-05 01:06:02 UTC
From: Robert D Houghton <rhought@cello.gina.calstate.edu>
Message-ID: <3btp1q$c6o@cello.gina.calstate.edu>
Source record: 46123

Regarding the question about DSP-1232 doppler correction.

The up/down doppler correction (STEP ON) for the DSP-1232 firmware ver. 7.0 dated 12/93 does work with the following caveats:

1) Only works on 1200 baud psk modems (modem 13)

2) The mic up/down control lines for radio 1 and radio 2 are REVERSED in the pinout diagram in the AEA manual. That one cost me 2 months before someone (*not* AEA tech support!) clued me in. I guess I should have been smart enough to figure that out (I tried LOTS of other things) but one tends to trust documentation that comes from the manufacturer. :)

I am now quite happy with the AEA 1232.

Good Luck,

Bob KC6LVG

[some deleted]

Hi Paul... Yes the GRAPES 56k Modem is still available. Below is our email blurb. Email me direct if you additional info.

Heatherington WA4DSY 56KB RF Modem

GRAPES (a Non-Profit Volunteer Organization of Georgia Amateur Radio Operators) is selling full kits of the WA4DSY 56KB RF Modem for $250. The proceeds from the kits support our club's network building activities.

To go along with the kit, you'll need a transverter with a 28 MHz I.F., a case, connectors, power supply and frequency determining crystals. The printed circuit boards, documentation, State EPROM, support diskette and all other parts are supplied in the kit.

To drive the modem, we provide instructions with the kit to modify your tnc-2 for operation as a "kiss56 tnc". However, the tnc-2 serial port is limited to 38.4kbps, so you may want to use Ottawa PI Cards to fully utilize the modem. The PI cards are easily capable of sustained 56kbps thruput (the PI2 cards have been tested to over 460kbps). The PI2 is available from the Ottawa Amateur Radio Club for about $130 US, try pi-info@hydra.carleton.ca for more details.

The transverter chosen should switch as quickly as possible in the 5-15 msec range to be effective. We use the Microwave Modules MMt 432-28S units; however, these are getting difficult to find except as used ones at hamfests. The last few we purchased new were also pretty expensive ($389). We believe that their 220 MHz units were quite a bit cheaper, but we've never bought any new. On the hamfest market, we have been paying $125 to $185 for used, normally working units.

Maple Leaf Communications (Bob Morton, VE3BFM) is shipping a 220 transverter which has good charactertistics and an even better price tag ($279). We have two of these units and they seem to work fine. Contact Bob at 705-435-0689 or RR #1, Everett, ONTARIO, Canada, L0M 1J0.

The transverter must be linear as the modem has amplitude variations as part of the converyed modulation, which must be reproduced by the transverter. Usually any transverter capable of SSB operation is suitable if it switches quickly enough.

We also sell a printed circuit board set that includes the State EPROM, documentation and support diskette for $110. Documentation sets are available separately for $20 and we have a VHS (beta by special request) Video tape featuring Dale Heatherington explaining the Beta modem design for $20.

Doumentation sets are creditable towards the full parts kits or board sets and the board sets are also creditable towards the full parts kits.

We pay U.S. shipping, however, we do require that the approximate difference between domestic ground delivery and premium shipping be sent in advance. Overseas second day air can cost up to $60 per kit! The kits weigh about 2.5 pounds each, and we can put 3 to 4 kits in a single box to save on shipping.

Please mail your orders (a letter is fine) with your check or money order payable in US funds to:

GRAPES, Inc.
PO Box 636
Griffin, GA 30224-0636

We're sorry, but we cannot accept Purchase Orders nor Credit Cards and we have no fax machine available. Please allow four to six weeks for delivery.

For more info email: ka4byp@mail.radio.org

73/Bob

> Bryan - KA1FQT

Yes Bryan, you have heard correctly and it works! The best place to start is to read Terry Dawson's "Linux NET-2/NET-3 HOWTO" available at

sunsite.unc.edu in /pub/Linux/docs/howto

Terry explains in section 12 how to get the code needed to compile into the Linux Kernel and how to set it up for operation. I won't go into it all here, but sufice to say the HOWTO will get you going. It is not hard to do.

I have AX.25 up and running on several machines. I can ftp and telnet between them using 9600 bps packet. You can run AX.25/Linux to TNCs in KISS mode. I have 2 Ottawa PI2 cards that I am going to put into my machines next.

The neatest thing I've been doing is using Mosaic on one machine and httpd (a web server) on another. Opens up some real possiblities.

73, Steve N7HPR

Goedenavond allemaal, zo net voor Sinterklaas avond hebben wij dan
het 14e World Link RTTY bulletin. Hebt U misschien nog net de tijd
om eens rond te kijken wat voor speeltjes Sinterklaas nog kan mee-
brengen.. Want U maakt toch tegenwoordig niks meer zelf. ??? Ben je
nu helemaal gek... Een beetje zendamateur heeft toch alleen maar van
die glimmende toeters en bellen waarmee hij zijn niets begrijpende
familie leden versteld doet staan.???? Of brengt St.Klaas in plaats
van grote dozen glimmer misschien bij U nog van die zakken vol met
onderdelen, zodat U de winter weer met veel plezier doorkomt.??? Ik
hoop dat het laatste bij U van toepassing is, en dat de Sint U nadat
hij allang weer in Spanje zit, U trots kunt laten zijn op wat U nu
dan toch maar weer hebt gemaakt..hi... Maar goed.. het is altijd nog
geen Sinterklaasavond dus heb geduld en lees gezellig verder met dit
```

Bulletin.. Inmelden kan weer tijdens de uitzending via (05125) 2702.
En straks natuurlijk wanneer wij QSY gaan naar 145.325 Mhz.....
Tot straks..... Weit, PA3ESF.

++ PA3ESF + THE WORLD LINK RTTY BULLETIN + URETERP + R14 + JO33CC ++

SATELLIETEN METEOSAT. In het kader van de ESA een afkorting van
---------- European Space Agency, zeg maar de europese
ruimte organisatie,(waarin een aantal europese landen zijn verenigd)
is er een type weersatelliet ontwikkeld die men de naam ''METEOSAT''
heeft gegeven Deze geostationaire satelliet is vanaf november 1977
gelanceerd naaar het snijpunt boven de evenaar en 0 (Greenwich) me-
ridiaan. Daarbij heeft de satelliet een uitzicht over Zuid- en
Midden-Europa, de Atlantische oceaan en Afrika. Van dit gebied maakt
de satelliet elk half uur een opname zowel met infrarood als zicht-
baar licht en zendt deze direkt over. Tevens wordt de satelliet
gebruikt als relais-station voor het centrale grondstation, dat na
bewerking de foto's en aanverwante gegevens heruitzend naar ander
stations. Ook geeft de Meteosat satelliet gegevens door die het
ontvangt van weer andere automatisch bediende weerstations, naar
ontvangstations op aarde.

FRANKRIJK, USSR. Van de Russische activiteiten op 't gebied van
========== meteorologische sateLlieten werden Tussen 1966 en
1969 een zestal KOSMOS satel lieten gelanceerd, uitgerust met appa-
ratuur om straling en bewolking waar te nemen. Deze werden opgevolgd
in 1971 door de METEOR satellieten die apparatuur bevatte gelijk aan
de Amerikaanse satellieten werkend volgens het APT systeem. Eveneens
in 1971 werd een Franse satelliet gelanceerd met de naam EOLE. Daar-
bij werden kort na de lancering, in Zuid Amerika 500 ballonnen opge-
laten, die op ongeveer 11 KM hoogte zwevende gehouden werden, omdat
de luchtdruk daar 200 mbar bedroeg. De EOLE satelliet op zijn beurt
bepaalde hun lokatie regelmatig en zo konden de winden op genoemde
hoogte worden gemeten. Ook vonden er temperatuurmetingen plaats, die
met alle andere gegevens verstuurd werden aan het volgstation.
..... wordt vervolgd. bron .: PA3BKW.

++ PA3ESF + THE WORLD LINK RTTY BULLETIN + URETERP + R14 + JO33CC ++

KWHR - HAWAII. Ruim een jaar geleden kwam het religieuze station
---------- KWHR voor het eerst in de ether. Op eerste Kerstdag
1993 nam het moederbedrijf LeSea Broadcasting een 100 KW sterke
zender in gebruik bij Naalehu, op het zuidelijkste punt van Hawaii.
De programma's van KWHR zijn identiek aan die van het station WHRI
uit de Amerikaanse staat Indiana en worden door middel van de Galaxy
satelliet vanuit de VS naar Hawaii overgestraald. De twee antennes
bij Naalehu- een dipool gordijnantenne en een log periodic staan
gericht op Azie en het Pacifisch gebied. Er zijn daarom in het afge-
lopen jaar niet zoveel gelegenheden geweest om de zender in Neder-
land of Belgie te beluisteren. Omdat KWHR het enige kortegolf
omroepstation op Hawaii is, blijft het de moeite waard om naar zijn
signalen te speuren. In het winterschema zijn twee van de vijf

frequenties voor ons van belang. Op 9930 kHz zendt KWHR uit tussen 04.00 en 16.00 uur UTC. Gezien de huidige propagatie-mogelijkheden, liggen de beste ontvangstkansen hier tussen ruwweg 09.00 en 14.00 uur UTC. Dat wil zeggen, tot ca.11.00 uur via het korte pad en vanaf ongeveer 13.00 via het lange pad. Op 13625 kHz zendt KWHR tussen 18.00 en 20.00 uur UTC en zouden de signalen ons theoretisch via het lange pad kunnen bereiken...
..... Bron .: Radio Amateur Magazine Nov.'94.

Radio Nederland Wereld Omroep. Het nieuwe zendschema van de Hilver-
---------- sumse Wereldomroep laat enkele op-
zienbarende veranderingen zien. Het meest opvallend is wel de introductie van een relaystation in Duitsland. In de praktijk bleek het zenderpark bij Zeewolde niet zo geschikt voor uitzendingen in de richting van Engeland. Radio Nederland besloot daarop om voor de Engelstalige uitzending tussen 11.30 en 13.25 uur UTC faciliteiten van onze oosterburen te huren. Daarbij wordt gebruik gemaakt van het zenderpark Nauen,in de voormalige DDR. Zo'n vijf jaar geleden waren deze zenders nog in gebruik bij de communistische Stimme der DDR. sinds eind september kunt u vanuit Nauen op 7130 kHz dagelijks Ginger da Silva, Harry Kliphuis, Marijke van der Meer en andere Wereldomroep-cotyfeeen horen. Ook opvallend is de introductie van de middengolf-frequentie 1386 kHz voor het avondprogramma tussen 20.00 en 23.30 uur UTC. De zender die de Wereldomroep hiervoor huurt,staat in Bolshakovo in de Russische enclave Kaliningrad. De indrukwekkende antenne is gemonteerd op twee parallel opgestelde rijen van elk vier masten. Deze zomer werd de zender in Bolshakovo al eens gehuurd, om wedstrijdverslagen van de wereldkampioenschappen voetbal te relay-
eren.

Crisis Joegoslavie:Frequentie's. Voor bezitters van een kortegolf
---------- (HF)-ontvanger plaats ik wat info ivm. de crisis in ex-Joegoslavie, dit heb ik al eerder losgelaten op de BBS, maar gezien de omstandigheden nu, wellicht interessant om te weten. Ondergetekende betreurt deze bloedige oorlog,in het land waar ik zelf in '89 en '90 vakantie had (Kroatie en Montenegro) ,een land met vriendelijke mensen, en waar nu vrouwen en kinderen op afschuwelijke manier worden afgeslacht, toch zo relatief dichtbij Nederland.

Op 5310 kHz kun je allerlei onderling communicatie verkeer waarnemen van Westerse landen die toezien op naleving van de zgn. handelsblokkade zoals scheepsbewegingen in de diverse gecontroleerde wateren. Ook grondradar en AWACS tref je hier aan. Verkeer tussen AWACS onderling vindt plaats op en rondom 6723 kHz. De AWACS Stijgen doorgaans op vanuit Gelsenkirchen en als callsign wordt vaak 'DHN66' gebruikt.Luister eens op 11270,5 en 6762,5 kHz. Ook heeft het nut op 6738 kHz te luisteren,hierop is militair vliegverkeer te horen dat zorg draagt voor aanvoer van humanitaire hulpgoederen. Datzelfde

geldt voor de volgende frequentie-gebieden .:

4725- 4745 kHz, 6730- 6750 kHz, 8965- 8995 kHz, 11175-11235 kHz,
13200-13260 kHz, 15000-15100 kHz, 17950-18020 kHzn 23220-23260 kHz.

(Mode is USB). Daarnaast is natuurlijk FleetSatcom satellietverkeer
te horen. Afhankelijk van de kwaliteit v/d antenne kan,vooral rond
het middaguur, communicatie waargenomen worden tussen 261.450 en
261.950 MHz.(N/FM-mode).

PERSBERICHTEN. Via de kortegolf maken ambassades over de hele
-------------- wereld contact met het Ministerie van Buitenlandse
Zaken in het land van oorsprong. Andersom worden ook (pers)berichten
naar die ambassades gezonden. Op diverse freq. zijn RTTY-berichten
te zien van 'DFZG'. De persberichten moeten met een korrel zout ge-
nomen worden, want het betreft doorgaans Servische propaganda.
Engelstalige persberichten worden de ether ingestuurd vanaf ca. 1430
u UTC Baudrate 75Bd. 9056, 11140, 13400, 18055, 20130 en 22890 kHz.
De uitzendingen beginnen met allerlei afkortingen en codes,zoals de
callsign. Dit wordt gedaan zodat de div. ambassades af kunnen
stemmen, en dit kan best een kwartier duren.Daarna volgen meestal
berichten. in de Servische taal en gecodeerde berichten voor diverse
ambassade personeel, meestal te herkennen aan een reeks letter- en
getallencodes. Daarna volgen dan de Engelstalige berichten. Stop
maar een flink pak papier in je printer, want een pagina of 50
berichten zijn geen uitzondering..

TANJUG. (Telegrafska Agencija Nova Jugoslavija) Dit bekende pers-
------- bureau heeft over de hele wereld haar persmuskieten zitten,
en zendt dan ook berichten van allerlei aard uit, en wat niet wense-
lijk is, uiteraard NIET). Je zou het zo niet zeggen van een int.
persbureau,maar de spelling en grammatica van Engelstalige berichten
is vaak allerbelabberst. Er is dus niets aan de hand met uw decoder.
De callsigns beginnen met YZD of YZJ en de Baudrate is 50.

7658 kHz (24 uur p/d) 7806 kHz (1700-0400) 7996 kHz (1700-0400)
11604 kHz (0400-1700) 13440 kHz (0400-1700)

DIVERSE STATIONS. Populair voor berichten vanuit Joegoslavie is de
----------------- 40 Meter-Amateurband (7.0-7.1MHz). Hoewel het
onderste stukje van 40 kHz bedoeld is voor CW, kom je hier vaak
Joegoslavische stations tegen in 'phone'. Daarnaast vindt net onder
de amateurbanden veel communicatie plaats, niet alleen van en naar
zendamateurs, maar ook tussen militaire groeperingen. Het laat zich
raden, dat men geen uren op dezelfde freq. blijft 'hangen'. Draai de
freq. eens af vanaf p/m 6930-7100 kHz. USB/LSB worden beide gebruikt
Verder zijn er nog legale en niet-geregistreerde radio-stations (AM)
te vinden tussen 6200-6300 kHz. Radio Bosnia-Herzegovina tref je aan
op en rondom 6218 kHz. Hoor je in dit gebied iets,wil dat nog niet

meteen zeggen,dat het een radio-station is,het eerste 30 kHz stukje wordt nl. ook gebruikt in de scheepvaart (phone). Radio Zagreb (Kroatie), vaak gestoord door Serviers, en derhalve vaak van freq. gewisseld, vindt je op 13830 kHz en is het best te beluisteren tussen 2000-2230 uur UTC. Radio YUGASLAVIA zendt uit op 11870, 17740 en 21605 kHz.
..... Bron .: CB packet-net van NL1MNS @ RY1BBS.OV.NLD uit Meppel.

STROOM (17) Allessandro Volta. De elektriseermachines zouden zeker
------------------------------ steeds groter zijn geworden, de Leidse flessen steeds verder zijn verbeterd, wanneer niet tegen het eind van de achttiende eeuw een nog veel beter idee was geboren in het brein van Allessandro Volta, een Italiaan dit keer, de uitvinder van het elektrisch element en daarmee de grondlegger van 'de batterij'. Volta was een zorgenkind. Op zijn vierde kon hij nog niet praten. Maar hij haalde die achterstand ruimschoots in. Wat hij eerst helemaal niet kon, deed hij later vlot in vijf talen waaronder Nerderlands. Zo kon hij, eenmaal gegrepen door de wonderen van de elektriciteit - toen de grote rage in Europa -, corresponderen met onderzoekers in andere landen. Hij was achttien toen hij al in een geschrift probeerde aan te tonen dat de zwaartekracht uit de elektriciteit verklaard kon worden. Maar hij was ook praktisch.
Hij bedacht een elektrisch pistool waarmee hij moerasgas, dat hij opving in het meer van Como, tot ontpolffing kon brengen.Hij opperde ook in 1777 de mogelijkheid om langs houten palen een draadverbinding te maken tussen Como en Milaan, een afstand van vijftig kilometer. Langs die draad zou dan een stroomstoot kunnen gaan die bij aankomst in Milaan het elektrische pistool vanzelf zou doen afgaan. (Hoe lang het zou duren voordat de stroom daar was, wist toen nog niemand). Zijn element bedacht hij in 1880. Hij ontdekte dat er elektrische spanning ontstond wanneer twee stukken van verschillend metaal in een zoutoplossing werden gedompeld, zonder dat er verder nog enige spierkracht aan te pas kwam. Hij ontdekte ook dat men zoveel bakken achter elkaar, of op elkaar - de Zuil van Volta werd dat genoemd - kon plaatsen als men wou, en dat de spanning hoger werd naarmate het aantal bakken toenam. Het eind was zoek. Hij ging met zijn toestel op reis door West-Europa, een hele onderneming in die tijd - hij had zesentwintig dagen nodig om van Pavia, waar hij professor was geworden, naar Parijs te komen -. Maar daar werd zijn moeite danig beloond. Zoals alle geleerden in die dagen, als kermisgasten bijna, hun kunst aan vorsten en adellijke lieden vertoonden, was ook Volta met zijn Zuil een sensatie, waar hij maar kwam.
Napoleon had allang begrepen dat de elektriciteit grote mogelijkheden in zich borg en maakte Volta graaf nadat hij de batterij met eigen ogen had gezien. Hij was zo onder de indruk van de vinding,dat hij twee jaar later nog, toen hij in de Nationale Bibliotheek in Parijs kwam, van een opschrift ter ere van Voltaire onmiddellijk de laatste drie letters liet wegslaan, zodat er kwam te staan, Au Grand Volta. Como, de geboorteplaats van Volta, eerde hem op zijn honderd-

ste sterfdag in 1927 met een marmeren graftempel in griekse stijl. Maar een onverwoestbaar monument had Volta al eerder gekregen. In 1881 werd op het Internationale Elektrisch Congres in Parijs zijn naam voorgoed vastgelegd in alle talen als 'de eenheid van elektrische spanning'.
..... Wordt vervolgd..... Frans, PA3BKW.

FRAG. Friese Radio Amateur Groep te Leeuwarden houdt a.s. zaterdag
----- 10 december in het FRAG Club gebouw aan de Brandmeer 47a in Bilgaard te Leeuwarden een vlooienmarkt. Alles op het gebied van de hobby is er te vinden zo melde onze correspondent ter plaatse, Ljibbe, PA3FPE. U bent vanaf 10.00 uur tot 16.00 uur van harte welkom.. in het FRAG club gebouw....

TE KOOP. Meerdere keren kwam er bij de redaktie een verzoek binnen
-------- om in dit bulletin een rubriek op te nemen van het een of ander te koop aangeboden. Daar wilde ik het toch even over hebben... Berichten voor te koop of gevraagd, kunnen worden doorgegven aan de colega ronde leiders van het Hunnebednet te Assen (regiowinkel) of aan de Muntronde leiders (Muntwinkel). Voor de regiowinkel van het Hunnebednet kunt U dat doen aan Michel, PE1OZA via telefoon.nr.: 05929 1542 Ma t/m Vr 18:00 - 21:00. Voor de Muntwinkel kunt U Uw aanbiedingen doorgeven tijdens de Muntronde op de repeater van Akrum op 145.700 Mhz (20.00 uur op Zondag) of telefonisch via het tijdens deze ronde genoemd telefoon nummer. Waarbij gesteld dat aanbiedingen niet van commerciele aard mogen zijn en,let U daar vooral op als het zendaparatuur betreft, dit enkel en alleen mag worden verkocht aan daarvoor bevoegde personen (gelicenseerde zendamateurs). Dit ter voorkoming van oneigelijk gebruik op de amateurbanden.. (piraterij). Zie daarvoor ook de bepalingen in de machtigingsvoorwaarden o.a. het bijhouden van een register voor het in bezit, danwel verkocht hebben van de aparatuur..... Bij niet nakomen van deze bepaling volgt voor de zendamateur een boete van 500,= en voor handelaren is dit 2500,=. Zie voor meer info ook de publikatie van de HDTP t.a.v. het sanctiebeleid.... Maar buiten deze zaken.... is het zowiezo ook voor Uw collega zendamateurs prettig te weten dat ze gevrijwaard blijven van gestoor op de amateurbanden van lieden die hiervoor geen toestemming hebben ontvangen van de HDTP en/of omdat er weer eens een collega 'amateur' meer zag in harde valuta dan in sociaal collegiaal gedrag. 't is maar even dat U dit weet..... Weit, PA3ESF.

TENSLOTTE. hebben wij U nog mede te delen dat wij volgende week er
---------- natuurlijk weer zijn.. Dat er op dit monent leuke SWL info wordt aangeleverd uit alle hoeken van Nederland.. Dat ik graag zie dat dit ook zo doorgaat... Dat U hier via het bulletin weer Uw voordeel mee kunt doen.. Dat ik dat weer heel plezierig vindt.. En ik dan ook vraag aan al die informanten... BLIJFT U A.U.B. DOORGAAN MET DIE MOOIE INFO.... En..... als U dat nog niet deed.. dit kunt sturen aan Weit, PA3ESF via PI8FWD, of CB1WLU via DR1BBS of via

Internet aan CB1WLU@CBPACKHV.XS4ALL.NL ... Maar U kunt het ook heel gewoon doen via Bouekers 40, 9247AR te Ureterp.... of U belt even met mij net als U dat vanavond voor het inmelden nog kunt doen via tel .: (0)5125 27 02 ... Voor de zendamateurs gaan wij nu QSY naar 145.325 Mhz en ik hoop U volgende week weer aan te mogen treffen op deze qrg... Prettige avond verders... en doe St.Klaas de groeten van mij..... 73' Weit, PA3ESF.

Source record: 46025

From: zeta@skypoint.com
Subject: CDMA IS-95 and PCS
Organization: The Complete Solution

I'm looking for information on the IS-95 (CDMA) protocol for use in wireless communciations.

I know about the qualcomm site and have already retrieved the CDMA docs there but they are in .PS format which I do not have the ability to view, edit, or print out. I would appreciate any help in finding more information.

I also am searching for information on the emerging "PCS" technology as well.

If anyone knows where I can locate more information on these subjects please let
me know..

Thanks
Greg Youngblood

4539. NET_Mac2.3.46.sea.hqx.text

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-05 09:41:01 UTC
From: adam@iag.TNO.NL
Message-ID: <9412050941.AA13871@iag.tno.nl>
Source record: 46131

```
The Netherlands, December 5, 1994.
Hello dear reader,

Today I distributed NET_Mac2.3.46.sea.hqx...

For those who don't know NET/Mac... NET/Mac is the application that
supports TCP/IP over packet-radio, which means, that hamradio operators
can use NET/Mac for their wireless TCP/IP network...

In this version of NET/Mac I implemented the following:

- Support 'adjustclock' command
- Support 'fontsize' command
- Speed-up hostname lookups from the hosts.net file

This version obsoletes all versions of info-mac/comm/radio-net-mac in
the Sumex-Aim archives.

The new NET/Mac has (hopefully) been uploaded to:
ftp.ucsd.edu, to the directory hamradio/packet/tcpip/incoming.
If it's not there then look at hamradio/packet/tcpip/mac.

Scott WY1Z may have also uploaded the new version to:
oak.oakland.edu, to the directory pub/hamradio/mac/digital

Kind regards and (maybe a little early...) Merry Xmas and a prosperous 1995,

Adam PA2AGA (e-mail: adam@iag.tno.nl )
( or: pa2aga@iag.tno.nl for letters only, NO BIG files here)
```

(fortunately!!!).

If you are using NOS, add the following command to your autoexec.nos file:

param <iface> rts 1

It is probably a good idea to set dtr to 1 the same way.

4541. RTS flow control in TAPR KISS mode?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-05 12:53:12 UTC
From: svp@cam-orl.co.uk
Message-ID: <3bv2fo$dku@lyra.csx.cam.ac.uk>
Source record: 46132

Hello - I wonder if anyone can help me?
I want to run TCP/IP, 9600 baud packet with a small portable (ie SLOW) PC.

I'm trying to get a TNC with TAPR 1.1.8 firmware to do RTS flow control - that is
I want it to stop sending characters in a KISS frame if my host (a very slow PC!)
drops its RTS line on the rs232c connector.

I have observed that the same firmware honors the RTS signal in "native" (non-KISS) mode,
so I know the hardware is capable of working properly ...

As a workaround, I have reduced my serial baud rate to 4800; but at 9600 I find the host PC
is dropping characters from long frames so that I get TCP CheckSum errors (fortunately!!!).

Thanks in advance,

4542. Baycom 1.7 possible virus?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-05 12:54:39 UTC
From: aballen@COLBY.EDU
Message-ID: <9412051254.AA12482@host0.COLBY.EDU>
Source record: 46133

I downloaded Baycom Version 1.7 from a landline BBS and proceeded
to use the packet cluster to distribute the new software. One of
the stations I sent it to, replied with this.....

> There is indeed a virus in that bogus version of baycom, it is
> residing in l2...My microsoft anti virus won't recognize it but
> heres how i know its there...

> When i load the bogus L2 into memory, it takes up 80k when i
> check the memory using microsoft MEM... when i "unload" it,
> only 65k of memory is freed up, the other 15k wont show up
> listed on the MEM program. However, the bytes free indicator
> says that 15k is being used somewhere...My processor speed
> goes from 90% to 110% after using this bogus L2 and removing
> it, and i get random resets. heres the thing, after the computer
> resets by itself, all memory is wiped out.....Except that darn 15k...
> only way to get rid of it is to kill the power, after that the
> resets will stop too.

Maybe there is a problem, maybe there isn't...I am not knowledgable
in virus detection. But this message is posted for the benefit of
anyone who might like to investigate this problem. I have kept the
original zipped download of the baycom version 1.7 on my computer
without any ill effects, so far, that is....

By the way, a small group of locals have figured out how to use the packet
cluster to send binary files, without errors, using the packet cluster.
If anyone wants further technical details on the process, please send
me email direct-do not post requests for this info in this publication.

73 de Art, KY1K...

4543. Where to find PACKET TCP/IP addresses ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-05 13:56:12 UTC
From: mrus@intgp12.ih.att.com
Message-ID: <D0CC1o.14L@nntpa.cb.att.com>
Source record: 46134

Can anyone tell me where I can find the most up to date
list of Packet TCP/IP addresses ?

Thanks in advance,

Martin

4544. Re: RTTY, Hamcom, and stuff

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-05 14:14:01 UTC
From: dennisg@microware.com
Message-ID: <3bv779$8k2@mcrware.microware.com>
Source record: 46135

As a follow-up to my own post.... I experimented further and finally figured out what was wrong. I was xmitting upside down (normal) on LSB. I receive using narrow CW mode on my FT-890 (USB). I have to flip keying to reverse to xmit on SSB (LSB), and then flip back to normal to receive in narrow CW.

I don't yet know if there is some sort of relationship between keying orientation and which sideband you're on. I have found nothing documenting it anyway. I know that there is a relationship in AMTOR, so maybe this is true for RTTY also? Anyway, once I figured it out I had a ball with RTTY QSO's.

4545. Re: TCP/IP via Net/ROM nodes?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-05 14:50:45 UTC
From: aswNS@hamp.hampshire.edu
Message-ID: <3bv9c5$fnm@gort.oit.umass.edu>
Source record: 46137

On 1 Dec 1994 14:38:39 GMT Albert S Woodhull (aswNS@hamp.hampshire.edu) wrote in rec.radio.amateur.digital.misc:

: Ian Wade's NOSIntro book mentions that Net/ROM nodes of verison X1G
: and later can act as TCP/IP routers, but I am unable to figure out how
: to take advantage of this.
...
: I am using PA0GRI NOS, the Nov 1991 version. Is this version possibly
: lacking some feature I need to take advantage of NetROM IP routing?

Thanks to all who have posted and written to me. It is working now. I had some wrong information and some wrong expectations.

The wrong info was that I didn't have the correct IP number for the node, I had an IP number for the sysop's call with a different SSID. Once I got that straight I was able to ping the node and verify that it indeed knew something about AX.25 encapsulation of IP packets.

Additionally I didn't have a proper route with the gateway specified. Once I added the route I was able to get through the node to other NOS nodes.

The wrong expectation was that I thought I could telnet directly to the node, but by tracing packets I discovered that the node was responding to my connect attempts with a message indicating the service was unavailable.

4547. Help with FBB and MFJ!!!!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-05 15:12:40 UTC
From: strongst@plhp145.comm.mot.com
Message-ID: <strongst.786640360@plhp145>
Source record: 45954

Hi all,

If anyone has had any luck with (or knows how to) get FBB working with an MFJ1278B TNC I would appreciate some help.

1st problem appears to me to be that FBB can't handle doing what is needed to do an auto baud detect with the TNC. So I tried going into a terminal program and getting the TNC going on 9600 baud. Then I exit the terminal program and try to run FBB (set up for 9600 baud of course). Sometimes this will work (sort of) and get me past the "Init TNC - PK232 Host mode" (or something to that effect).

2nd problem then pops up at this point. When FBB finally gets to the normal screens, the numbers for port I think bop around a good bit and the display window shows something like:

pk_send : error <CMD: GG>

I think it is a KISS command. So... I went back to the terminal program and turned KISS mode on and did a RESTART. Now the TNC is in KISS mode (LEDs flash 3 times) and I exit and run FBB.

Now all it seems to do is get stuck on the PK232 Host Mode thing and every so often issues a "Sending Reset". I can't get anywhere from this point.

I have tried WA8DED and BPQ as TNC types in port.sys. I have played some with the inittnc1.sys and inittnc.pk files with no success.

I can't even find were I would set things like # of data bits and parity type... thought this might help too... (as I pull a clump of hair out of my head).

Can anyone help????? OR... is there BBS software out there that is better???? same or more features and easier to get working!

H E L P pse and tnx in adv.

73,
Steve

4548. FSK Modem With Scalable Baud Rate

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-05 15:17:01 UTC
From: seeler@UPEI.CA
Message-ID: <seeler.154.786640621@UPEI.CA>
Source record: 46138

Hi - I am interested in the FSK modem that was described in the 13th ARRL Digital Conference (1994) which can do DC to 19k2. The paper was by W.-H. Rech and G. Jost. Has anyone had the opportunity to try this modem out? Has it been used for 220, 440 MHz operations - if so how did / does it do? I have noticed that TAPR has indicated an interest in supplying 1.2GHz digital radios by G-W Rech. Does this system use the scalable baud rate FSK modem? Is the modem available separately?

Any information would be greatly appreciated!

I would like to have greater capability with my PK232M
than it has at present.
Can you use a higher paclen like 1000 ? if using different
software ?
Can I have my BBS take mail off HF and diall up a land line to
up and down load mail
IE WORM HOLE THRU internet ?
Automatically PKZIP and UNZIP files in mail areas ?
I use only HF packet at present and the 232 manual
leaves me pretty sleepy...It also seems to be very limited
and I feel there must be software that willl do what I would
like to do . I am very new to packet and I guess this all
must look like silly questions to the vets of packet.

4550. CDMA IS-95 and PCS

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-05 16:19:33 UTC
From: zeta@skypoint.com
Message-ID: <3bveil$iuc@stratus.skypoint.net>
Source record: 46139
Cross-posted to: comp.dcom.telecom.tech,alt.cellular-phone-tech,rec.radio.amateur.digital,rec.radio.amateur.digital.misc

I'm looking for information on the IS-95 (CDMA) protocol for use in wireless communciations.

I know about the qualcomm site and have already retrieved the CDMA docs there but they are in .PS format which I do not have the ability to view, edit, or print out. I would appreciate any help in finding more information.

I also am searching for information on the emerging "PCS" technology as well.

If anyone knows where I can locate more information on these subjects please let me know..

Thanks

4551. Re: 2400 with TCM3105

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-05 17:43:18 UTC
From: kurpiers@hera.uet.e-technik.th-darmstadt.de
Message-ID: <3bvjfm$ak3@rs18.hrz.th-darmstadt.de>
Source record: 45993

Hello!

It is actually possible to use the TCM3105 with 2400 baud by just using a different quartz. There are several digipeaters here in Germany that use this modulation scheme.
The main problem is, that the higher tone is now very high (4800 Hz) and is usually attenuated at least 10dB with normal radios. So you need noisefree signals and perhaps modified radios for 2k4 operation. The BER is very high compared to normal 1k2 operation with the same S/N.

My personal opinion: don't try it. Try 9k6 using G3RUH/DF9IC etc. type modems.

From: he@monk.physio.nwu.edu
Message-ID: <3bvmvv$mvt@news.acns.nwu.edu>
Source record: 45992

I just passed my Technician-Plus exams and try to set up a packet radion station. Someone recommended TAPR DSP-93 kit as TNC. I tried to get more details on that kit from TAPR, but received nothing more than the information in the article in QST magazine. Is there someone out there has more details and experience on that kit? More specifically I would like to know:

(1) What special equipments, besides solder and multimeter, do I need to put the kit together?

(2) How programmable is the TNC? Does the kit come with any development tools? Can I download program to it from a PC?

(3) What are the technical data of this TNC? Like size of memory, mailbox, the modes supported, etc.?

Thanks in advance. I tried to subscribe DSP-93 mail list from TAPR, but been told the list has not been formed yet.

Liang

>
>I am using PA0GRI NOS, the Nov 1991 version. Is this version possibly
>lacking some feature I need to take advantage of NetROM IP routing?
>
I think you have something mixed up somewhere....you just your system to think that the X1J node is another NOS system that you can route IP packets through.

So, you have its callsign and its IP address.....then you do something like

For instance I have a node known as VE6PAQ-1 [44.135.152.2]...so I just do something like:

```
arp add 44.135.152.2 ax1 VE6PAQ-1
route addprivate default ax1 44.135.152.2
```

I don't have autoexec.nos handy...but hopefully you get the idea.

Hi, I have a question regarding the kenwood TS-450. Our club is operating a 450 into a long wire, through an external tuner. Unfortunately, I have misplaced the manual but know there are keypad commands to disable the internal tuner to operate the external tuner. Could someone who has a 450 please let me know what the command is? I have to set the station up for a special event on Sunday evening. We were using a TS-850, which disabled the tuner by a panel button, but have to use the 450 this time. Thanks.

I just recently started playing with Net/Mac and wanted to thank you for taking the time to write this package for the mac. I went back and read some of the papers written about Net/Mac in the Computer Networking Conference notes and noticed that several years ago there was some talk about making the jump to a more mac-like interface and 'catching-up' with NOS (Domain Name lookup, etc...)

I was wondering if this was still in the works...

Thanks,
Chris

Contests.
Just enough time to advise you of the FAIRS data contest, sponsored jointly by: The Foundation for Amateur International Radio Service and Ulyanovsk Technical State University (Russia).

Contest period:
From 0000 Saturday 9, until 2400 Sunday 10, December.
Maximum operating time of 24 hours for single operators.

Contest call: CQ FAIRS Test.
Modes: RTTY, Amtor, Pactor.
Bands: 80, 40, 20, 15, 10 meters.

Categories:
A. Single operator all band.
B. Single operator single band.
C. Multi-operator all band.
D. Short Wave Listener.

Exchange message: Send, RST + CQ Zone number.
FAIRS station send, RST + FAIRS number.

Multipliers:
Count each DXCC country and each FAIRS number on each band.
Note: (CQ Zone does not count as multiplier).

QSO Points:
Count 3 points for QSO with own continent.
Count 5 points for QSO outside own continent.

Final score:
Total QSO points times total multipliers.
SWL rules apply as above.

Log sheets:
Use separate log sheets for each band. Logs must show, band, date and time in UTC, callsign, message sent and received, country multipliers and points claimed. Multi-Op stations must show names and callsigns of all operators involved with the station.

Mail your logs to: FAIRS Digital WW Contest manager,
Yuri Katyutin, UA4LCQ, P.O.Box 1200, Ulyanovsk, 432035 Russia.
(Closing date not mentioned. ed.)

Start 1995 with 3 hours of fun in the S.A.R.T.G. Happy New Year RTTY Contest.

Contest Period:
From 0800 until 1100 Sunday, January, 1. 1995.

Bands:
3.5 and 7 MHz. only two way RTTY.

Classes:
A) Single Operator. B) Multi-Operator. C) SWL's.

Message:
RST/QSO number/Own name + Happy New Year (in your own language).

Points:
One (1) point for each QSO on each band. The same station may be contacted once on each band.

Multipliers:
A multiplier of one (1) is given for each DXCC country (outside Scandinavia). and for each LA-OH-OZ-SM-TF prefix number (0-9) contacted on each band.

Final Score:
Sum of QSO points times sum of multipliers.

Logs:
Logs to be received by 21st January 1995, containing: Band, Time UTC, Message sent and received, Points and Multipliers. Use a separate sheet for each band and enclose a Summary sheet showing the Scoring, Class, Your call, Name and address.
Logs from Multi-Operator stations must contain the calls and names of all operators involved.
SWL's use the same rules, based on stations and messages copied.

Send Logs to:
SARTG Contest Manager, Bo Ohlsson, SM4CMG, Skulsta 1258, S-71041 Fellingsbro, Sweden.

Awards to: The Top 5 stations in each class and to the winner in each country. Your comments will be very much appreciated.

The ARRL RTTY Roundup starts 1800 Saturday 7, ends 2400 Sunday 8, January. Operate no more than 24 hours. Two rest periods (for a combined total of 6 hours) must be taken in two single blocks of time, clearly marked in the log.

Modes:
Baudot RTTY, ASCII, Amtor and Packet, (attended operation only).

Bands:
All Amateur bands, 3.5 to 30 MHz (excluding 10, 18 and 24 MHz).

Categories:
(A) Single operator, multi-band. One person performs all operating and logging functions.(The use of spotting nets or Packet cluster etc,is not permitted).
1) Less than 150 watts output.
2) 150 watts output or more.
(B) Multi-Operator, single transmitter only. More than one person operates, checks for dupes, keeps the log etc. The station must remain on any band for a minimum of 10 minutes before changing bands.

Exchange:
United States give signal report and state.
Canada give signal report and province.
DX give signal report and QSO serial number beginning with 001.

Scoring:
(A) Count one point for each completed QSO. A station may be worked once per band for QSO credit (but not for additional multipliers).
(B) Multipliers count only once (not once per band), each US state (except KH6 and KL7), each VE province (plus VE8 and VY1) and each DXCC country. KH6 and KL7 count only as separate DXCC countries. The USA or Canada do not count as DXCC countries.

Logs:
Entries must be post marked no later than 30 days after the end of the contest (February 9th 1995). No late entries accepted. Use ARRL RTTY Roundup forms or reasonable facsimile, submit your entry on diskette, upload your entry to the ARRL BBS, or send your entry to ARRL HQ via Internet.
Official entry forms are available from HQ for an SASE. with 2 units of first class postage or 4 IRC's.
Logs must indicate Band, Mode, Date, Time UTC, Calls and complete exchanges (sent and received), Multipliers and QSO points.
Multipliers should be clearly marked in the log the first time they are worked.
Entries with more than 200 QSO's total must include cross-check sheets (dupe sheets).
Send entries to:- ARRL Contest Branch, 225, Main Street, CT 06111. U.S.A.

Copy of the full rules for the above contests are available from the editor. Please enclose A4 SASE.

Notes of interest:
Syria. (YK). YK0A working 14 MHz. RTTY on November 23 as promised and making a very welcome sight. QSX up 1-5.

Sudan, (ST). ST2AA working a few stations on 14 MHz. RTTY November 22. but very active on Pactor.

Ghana, (9G). 9G1BS working both 21 and 14 MHz. RTTY at no set times. Making up for the shortage of data from recent expeditions.

Zambia, (9J). 9I30A is a special event call to celebrate 30 years of independence in Zambia.

Thanks this month to..
G3ZYP, GU0SUP, VK3EBP, DXNS, ARRL/ARLD, KB8NW/OPDX/BARF80.

BARTG caters for all DATA interests with information-components-kits -ready built units and software from experts. Members receive a 120 page quarterly journal devoted to data modes. Beginners guides for most data modes are available. The group sponsors HF and VHF RTTY contests, administers its own DX and members award scheme and runs an annual rally.

This copy of BARTG News is posted by Iain Kendall (G6ARO) who can be contacted via Internet e-mail at.. iain@humber.ac.uk Items for inclusion in the

broadcast may also be mailed to this address, as well as any queries regarding membership or services offered by BARTG.

Christmas greetings to all our readers from the team at GB2ATG.

Copy of the news as distributed by G0ARF 941129.

4567. Steinbrecher at Wireless Exhibition

Still trying to get my boss to feel this is important enough for
him to pay for the course, air, and lodging. That project I'm
on now isn't NEARLY as important as this!! ;-))

Anyone else going?

Wireless Symposium/Exhibition
February 15,16,17 1995
Santa Clara Convention Center
Santa Clara, California

Worskshop 4, Tuesday, Feb 14,1995, 8:30AM to 12:00PM
DIGITAL RECEIVERS and DSP $150.00
By: Dr. Donald Steinbrecher and Professor Fred Harris
"This halfday tutorial workshop will explore the performance limits
of systems designed to convert RF signals to the digital realm and
explain how to digitally process these signals for maximum effectiveness
in wireless communications. ...will explain how to achieve maximum
dynamic range and sensitivity in the RF-to-digital portions of a digital
receiver and how to apply DSP techniques for optimal channelizing
and demodulation of multiple communications channels."

Woskshop 5, Tuesday, Feb 14,1995, 2:30PM to 5:30PM
SPREAD SPECTRUM $150.00
by: Dr. Jack Holtzman
"...will cover the basic theories behind frequency-hopped and direct-
sequence systems and how to implement spread-spectrum systems
for maximum performance. This lively course will also highlight the
important aspects of CDMA and wireless LANS."

Any other hams involved in the field planning on attending either
of these??

4570. Re: Internet to AX.25 Gateways?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-06 14:19:25 UTC
From: david@stat.com
Message-ID: <3m2wwc10w165w@stat.com>
Source record: 46016

jtomason@li.net (Joe Tomasone) writes:

> I too am interested in finding an AX.25 <-> Internet mail gateway. If
> anyone is aware of one, please let me know. I am in the NY Metro
> area if that is relevant.

*** Please note, effective 11/1/94 the address of the internet side of
the gateway has changed from gate@wb7tpy.ampr.org to gate@stat.com
Please notify your contacts immediately of this change ***

How to Use the WB7TPY
Packet <-> Internet Gateway

First, some brief operational notes:

(1) Messages must not contain any foul language, or commercial purpose.
(2) Messages can only be sent to countries that the United States has
a third-party agreement. All others will be destroyed.
(3) Messages from the internet should be less then 5K in length.
No files should be sent.
(4) If you have questions, please do not hesitate to contact me either on
packet radio: WB7TPY@WB7TPY.AZ.USA.NA -or-
Internet : david@stat.com

(5) Have fun. Use the gateway as much as you like. That is what it is
there for.

From Internet to Packet

Send mail to the internet address of:

gate@stat.com

The first line of text must contain a full packet address, preceded with the
word "Packet:"

For example, mail to my packet address, would have the first line of text;

Packet: wb7tpy@wb7tpy.az.usa.na

** NOTE: this line MUST be left justified.

From Packet to Internet

Send as private mail (never a bulletin) to the packet address of:

gate@wb7tpy.az.usa.na

The first line of text must contain a full domained internet address,
proceeded with the word "Internet:"

For example, mail to my internet address, would have the first line of text;

Internet: david@primenet.com

*** Remember, this has to be left justified

>Is Spread Spectrum legal on 10Ghz, and is there a place to learn more about spread spectrum on the net or off?
>(oh, don't email, this is just a public workstation)

It's legal. What it is actually GOOD for (under the EXISTING part 97 regs) could be an interesting topic of debate. Any one actually running a real high-speed SS data link and moving data on a regular basis?

While you CAN experiment and see that it works, you cannot, IMO, implement a useful full-time digital data link (regardless of what the data is) using amateur SS. Then again, commercial license free ISM band SS equipment DOES do the job much better anyway.

The amateur regs limit PN code seqeunces and REQUIRE that you ID on the same band using NARROW band techniques. Kind of defeats the purpose of SS (at least for DS SS), IMO.

4575. KISS for Pac-Comm TNC-220?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-06 21:11:25 UTC
From: rvermeulen@ib.com
Message-ID: <3c2k1t$rme@da.bausch.nl>
Source record: 46012

Does anybody know of a - really working - replacement EPROM
for KISS mode on the Pac-Comm TNC-220?

This TNC I made -in the late 80's - from a kit delivered by
Pac-Comm Packet Radio Systems, Inc.
3652 W. Cypress Street, Tampa, FL 33607-4916, USA

It does not have a KISS mode, which I would like to use to
do TCP/IP. Off course I can use the Baycom modem, I know and I do,
but I would like to put the old TNC-220 to use again.

Does anybody know if the mentioned firm still exists and maybe if
they have an e-mail address?

> Thanks, Joe

Until last winter, I ran fbb on my 8088 without problem. It is a
little slow, when compared to something else, but works just fine.
You will need some added memory, since it would really have to be
crippled to run in 640k only. As for the 286? Like a champ! Again,
you need memory, so you will need to have the right chipset and proper
memory manager, like QRAM or Last Byte, etc. My main board is a 286
with 4 meg of ram and probably won't be replaced until next winter.

Gary

4578. Software AX.25 implementation?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-07 04:12:45 UTC
From: tedwards@Glue.umd.edu
Message-ID: <3c3cnt$nb1@reggae.src.umd.edu>
Source record: 46020

I am working on a pseudo-Bayesian mechanism for stabilizing AX.25 packet channels in time of high traffic.

My problem is that while I could detect some collisions of other people's packets (by examining a "resent packet" flag I will stuff into and AX.25 packet), I can't really detect my _own_ collisions since standard TNCs will go on "magically" resending a packet until it gets through.

What I would like is a AX.25 implementation in software that I can change into "faking" connections and such by sending out unproto packets, resending them at timeout, and making note of my own timeouts (for use in the stabilization algorithm).

I imagine the Baycom modem must have something like this...but I need source and something freely available, so I don't know if that would work.

Real quick, pseudo-Bayesian keeps track of collisions and just slows down the rate of transmission when more collisions imply greater packet backlog in the channel. And when there are successes, it speeds up again.

Is this what G-TOR does?

-Thomas

|>Does anybody know of a - really working - replacement EPROM
|>for KISS mode on the Pac-Comm TNC-220?

Yes, there is one : TNC220 EPROM with software version 1.1.6+ (released on October 88)

|>This TNC I made -in the late 80's - from a kit delivered by
|>Pac-Comm Packet Radio Systems, Inc.
|>3652 W. Cypress Street, Tampa, FL 33607-4916, USA

I've buy the TNC 220 ready to use with 1.1.6+ EPROM at the same adress on December
1989.

|>It does not have a KISS mode, which I would like to use to
|>do TCP/IP. Off course I can use the Baycom modem, I know and I do,
|>but I would like to put the old TNC-220 to use again.

Old ! Oldies but goldies man !!!! I use mine for packet and TCP/IP and it works
fine with the 2 radio ports, 32 k PMS and very good conception (based on TAPR TNC2)

|>Does anybody know if the mentioned firm still exists and maybe if
|>they have an e-mail address?

Yes, Pac Comm still exists. They sale now the BAYCOM 1.6 software and perharps
they can sale to you an EPROM with 1.1.6+ software release . The exact date of
1.1.6+ release is 25 / 10 / 1988 (display at my TNC 220 start up).

Note : Don't copy v 1.1.6+ EPROM for your TNC 220. This firmware is copyrighted !!!!

Note that TheNet X1J has an IP router built in so you do not have to encapsulate IP packets in AX.25 frames. Encapsulation is required when routing IP packets through digipeaters, TheNet 2.0st and others. Of course this assumes the X1J node has its IP router enabled and has included the proper routing entries in the IP and ARP tables. (Use the IP and ARP commands to view the routing tables on an X1J node.)

>The wrong expectation was that I thought I could telnet directly to
>the node, but by tracing packets I discovered that the node was
>responding to my connect attempts with a message indicating the
>service was unavailable.

Unfortunately not. TheNet X1J implements an IP router and rudimentary TCP/IP protocols. You can route IP packets through it, ping it, and it might also respond to ARP requests (can't remember for certain). But that's about it. Actually that's not bad considering all this is in a 128K split ROM.

There is, AFAIK, no working version of KISS code for the TNC-220 as
supplied by Pac-Comm.

It's a while since I sorted the version numbers out. However:

o all versions I've seen lock up solid if off-air packets are
received whilst the LEDs are doing their start-up dance

o the latest version I had from Pac-Comms UK agents thought, when
in KISS mode, that it was to use full-duplex operation - and
it ignored the command to go to half-duplex.

I took the previous version I had, and hacked the code to strip out
the LED dance. Since then it has been OK.

There is a TNC-220 KISS ROM image supplied with the G8BPQ software.
I'm not aware of anyone being able to get this to work. When I tried
it wouldn't transmit at all - ever!

Somebody from Pac-Comm used to be on e-mail. If you're still listening
chaps, I could fix the code if I had the source...

4585. V.29 MODEM FOR 9600 BAUDS PACKET

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-07 13:48:00 UTC
From: alain.bourassa@inno.com
Message-ID: <1674.4296.uupcb@inno.com>
Source record: 46049

Hello

While searching in my 73 amateur radio magazine collection for an old
article I have found this yesterday in the MAY 1990 edition
Here is a reprint of a part from a big article about ham radio in
Japan
It's talk about 9600 bauds packet in Japan using a V-29 modem
and an unmodified rig

HIGHER ON SSB THAN ON FM

JS1DSF and JL3OUW of the Packet Radio Users Group (PRUG) described in
CQ HAM RADIO the PRUG 9600 bps modem for the TNC-2 packet controller
that can be used with SSB and FM rigs without modification to the rig.
Transmitting at 9600 bps transfers messages much faster than at 1200 bps
especially for long frames, but phase lags caused by fading or multiple
path reception affect 9600 bds transmission much more severely.May 1989
experiments on 430 mhz SSB by JN1OLJ and JR2BNF show that 9600 bps
packet on SSB is possible using some un modified SSB transceivers such
as the IC-735

In the November 1989 issue of CQ HAM RADIO JL3OLW described this 9600
bps modem and modification to the MFJ-1278 TNC to accommodate it. The
YAMAHA YM7109 9600 bps FAX modem chip used by this modem, like the 9600
bps FAX and land-line modems used widely today, operates at 2400 bps and
uses the quadrature modulation technique to quadruple throughhput to
9600 bps using CITT V.29 standard. Using V.29, bit strings of four bits
(wich have 4x4=16 possible combinations) are sent as a unit by
modulating a 1700 hz subcarrier to produce eight different phase shifts
and then using high and low amplitude signals to produce 16 different
states (8x2=16). The modulation speed is one-fourth of 9600 bp, or 2400
bps. The subcarrier has sidebands which are one-half the modulation
speed 1700 +/- (2400/2). These sidebands in the 500-2900 hz range fall
within the 300 hz - 3 khz range used in amateur voice commmunications
that have an audio range of 300-3 khz. With the release of this
modem/TNC design and the avalability of the G3RUH modem in Japan,
9600 bps packet stations are becoming much more common there. See
figure 2 for a ciruit diagram of the PRUG 9600 bps modem.

A simple diagram with most of the IC unknow to me was included with
this article and no part list etc.

A friend of mine (who he's also a ham) bought two V.29 industrial
FAX last spring for almost a dime

We did some tests on them and they "seem" to work

Since Baycom 1.6 now support 9600 bps operation more test
on those units will be done this winter

Could you imagine 9600 operation on 20 meters ?

>I have another modem EXTERNAL it wrks fine with same setup..
>Any help any Idea is most welcome

The FBB / FBBIOS program is looking for the carrier detect (CD) line to come high and will not respond to the RING or RINGING from the modem. You can turn off the verbal output from the modem (depend on modem for command sequence) as it will somtimes confuse the FBB program..

Roger (roger@uptowne.com) wrote:
: I would like to have greater capability with my PK232M
: than it has at present.
: Can you use a higher paclen like 1000 ? if using different
: software ?

The maximum ax25 packet length is 256 bytes, essentially the reason it's called packet because 'packets' of information gets sent. There are ways to increase throughput though by either increasing the baud rate or by going full-duplex.

: Can I have my BBS take mail off HF and diall up a land line to
: up and down load mail
: IE WORM HOLE THRU internet ?

I think there are some legal questions about automatically forwarding messages over a phone line. If you have direct access to the Internet, you can get software that would run a Wormhole, but it would have to be coordinated with your local AMPRnet people and the Internet people.

: Automatically PKZIP and UNZIP files in mail areas ?

There are compressed forwarding software packages available but I don't think any of them use PKZIP. Some NOS versions use a compressed program called LZW for mail between NOS stations. Most TNCs are limited in what they can do. Most of the big automated features come from PC software instead of TNC firmware.

: I use only HF packet at present and the 232 manual
: leaves me pretty sleepy...It also seems to be very limited
: and I feel there must be software that willl do what I would

No, actually it's a matter of how the limited number of lines on the Mac's
8-pin DIN connector are utilized. There are different ways to wire a
cable to support things like hardware flow control versus carrier detect,
etc.

>Also, I think it is Bell 202? isn't there a small chip that will generate the
>tones from a data stream?

Bell 202 modem technology and AX25 are two completely separate things. AX25 is a link level protocol for managing data transfers, usually via packet radio, though AX25 would work just as well (or poorly) over a wired link. Bell 202 is a tone encoding system for raw bits that *can* be used with AX25 over radio, and in fact is in common use today on VHF amateur packet. But AX25, and packet, certainly aren't limited to Bell 202 signaling.

Bell 202 is long obsolete over telco systems, but there are still a few single chip modems that will support it, and it can easily be implemented with a PLL tone decoder chip and a function generator chip, that's how TAPR did it in their original TNC. Amateurs are slowly moving to more modern, and faster, modem technologies for packet radio, but the *voice* radios being used are now the limiting factor.

From: Tim Daniels <timd@duke.com>
Message-ID: <3c4sts$gd4@potogold.rmii.com>
Source record: 46033

Help !! I am having problems connecting with JNOS 1.10h
There is a station I want to telnet or FTP to (n0tzl).
When I use FTP or TELNET I get no response from him.
When I do an AX25 connect no problem. I have spoke with him and he has me in his domain.txt and route.txt. I also have him in both my files as well as a hard coded
route add. I can connect to another station via telnet no problem.
When I trace the packets I see that they send to KB0PMN->QST.
The IP is correct 44.40.2.196 to 44.20.2.59. However I still cannot to a TELNET or FTP to his station. I also have used another radio to monitor and make sure that I am indeed transmitting which is the case.
I am using a TM733a and a KPC-3.

Any suggestions ?

Tim Daniels

I sounds like your system is trying to arp the hardware address of the
destination and is not getting a response from the net. you could try
adding a arp entry (first display your arp table and see if there is an
entry for your destination.)
assuming your destination is 44.20.2.59 n0tzl
and your tnc is on port ax0

then try ARP ADD 44.20.2.59 AX25 N0TZL AX0

for stations that you connect to regularily you can add these entries to
stop the system from trying to find them itself, at current speeds this is
not very productive.

hope that helps

I'm surprised that you have gotten this to work at all. I was told
by the local 'experts' that you had to have a 'Real' computer to do TCP/IP.
There were annoyed when I told them I didn't consider *any* computer
running MS-DOS to be a Real computer.

Anyway the reason I asked in the first place was, I have a Zenith
Minisport and would like to run TCP/IP. Does anyone know if it can be
done? This is your basic XT.

4599. Cloverleaf modulation.

Newsgroup: rec.radio.amateur.digital.misc

Source record: 46040

Hi everyone,
I'm getting ready to get back into ham after a three year hiatus, listening to code on the morning commute etc. I hope to get some metal into the sky over the Christmas break.

Anyway. . . . I recall back in 1991 there was a lot of excitement over so-called "Clover" or Cloverleaf modulation, a new digital mode of superior performance. I wondered if there is any on-going development work or even commercial products by now? Any information or pointers would be appreciated. All I have is the ARRL networking conference books.

4600. A FAQ Available?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-08 04:15:37 UTC
From: bswitzer@uoguelph.ca
Message-ID: <3c6199$6sl@nermal.cs.uoguelph.ca>
Source record: 46044

I have been thinking about getting involved in HAM radios and Internet
access. What I want to know is, is there a FAQ available that will
answer all my questions? I think this would be the best place to
start, n'est pas? Bear in mind, here, we're talking extreme novice.
I know alot about Internet, but nothing about HAM.

4601. Creating Netrom workholes via internet?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-08 05:25:27 UTC
From: MARK@ardsley.business.uwo.ca
Message-ID: <MARK.1302.2EE698C7@ardsley.business.uwo.ca>
Source record: 46047

I have a well connected internet machine running linux. I also have a tnc. I would like to create an internet wormhole for netrom. A year or so ago I read some messages dealing with the subject, but I never kept any. I used to run KA9Q nos under dos.

Does anyone know where I should start? Even if I knew the name of the software I feel I could get it going myself. Currently there are many flavours of 'nos' and I don't want to download all of them if someone already knows the answer.

ps: I am in London Ontario if anyone wants to link up. The machine is called hamster.business.uwo.ca

Any help would be great.

: bart wb6hqk
:
: bart@wb6hqk.ampr.org
:
:
I do most of my ham radio operating from my QTH near Key West. There I
am plagued with line noise from 138KV power lines about 1/4 mile away,
liberally bathed in salt air. The noise level is often over S-9. I use
the NIR-10 DSP filter, which helps, with the following limitations:

No amount of audio filtering will make inaudible signals readable...i.e.
if your noise level is S-7, no filter will allow you to hear an S-5
signal. (IF noise blankers are another story, but so far no-one has made
an affordable amateur receiver with IF DSP.)

The NIR-10 takes a signal from which the words could barely be
understood, and makes it armchair copy. This is especially effective on
2 meters SSB in my situation, particularly Oscar-13 downlink.

Your best bet is to spend the time tracking down the source of the
interference, and spending money on directional antennas, which can
be used to null out the noise source.

What's modulation in MFJ, Kantronics 2400 baud modems ?

If it is AFSK, what's tone frequency ?

NOS will probably work, but not too well. A 6 MHz 286 even runs slowly. Some 8086 machines (Compaq DeskPro) have real problems with NOS. I suggest a version that has as few features as possible compiled in. You might also consider NET. There is a version by K5JB (available from TAPR) which has the basic mailbox stuff added.

My experience with a Timewave DSP-59+ is that it doesn't filter line noise. It can do an excellent job in filtering some atmospheric noises [white noise?], and, other times, not so good. I believe it depends on the frequency of the noise aligning with the frequency of the filter before it "kicks in" on the atmospheric noises.

I'd think an ordinary noise blanker filter would be the ticket for your line noise problem?

>mshrake@marlin.exchange.com
>KE4HTX

The best way <IMO> a beginner can get started with JNOS is to get the file called NOSVW304.ZIP. Don't remember where it is, but it is probably at ftp.ucsd.edu somewhere around in /hamradio/packet/tcpip/jnos or some variation. The file contains the "get-away special" which is a version of nos preconfigured to look exactly like the NOSINTRO book sold by the ARRL and available all over. I wouldn't mess with the source code unless you had the right compiler (Borland C 3.1 I hear) and have a lot of experience with it and the appropriate linker.

That said, you might want to examine how, if at all, you want to provide an internet/ham radio gateway. There are some subtantial legal barriers against allowing non-licensed folk access to the packet network. However, you might want to provide access to, say, this newsgroup.

You get an IP address from your local Co-ordinator. If you post your location, perhaps someone can direct you to him.

>I am using a TM733a and a KPC-3.

You could do a trace port-name 0111 trace.fil and post or send the
results to me. That would probably help. When you talk to a remote
station, unless you have an ARP ADD statement for that station, your
system should send an ARP request to the QST callsign that contains your
IP Address and callsign and the remote systems IP Address. This is an
ARP Request. The remote station should respond with an ARP reply that
has the same info, but has his callsign filled in with his IP Address.
Once that is done, you'll see your station talk directly with the remote
station and you'll see both your IP Addresses in the packet. When he
responds... he'll talk direct to you and have both your IP Addresses
in the IP Header.
Also... both stations should do an route look remote-station and make
sure that the route looks ok. If you can hit each other direct using ax.25,
then you should not have any gateways in your routing info.
Hope that helps.

anonymous ftp to minnie.cs.adfa.oz.au and check out the gateways area.
There's a gateways.something that will tell you most of what you need to
know.
As for software... if you've got a 386, ftp to dfwgate.ampr.org and
look for a recent .exe file. I think that dfwgate.ampr.org copies it
current version of NOS into the \pub directory each time it reboots. Do
an info (once you have a copy of NOS) and see if it has the ENCAP stuff
enables. If it does... then it can be run as a gateway. You also want to
have the TCP/IP ACCESS stuff enabled too. Do a
'finger info@dfwgate.ampr.org' to see what's enabled on dfwgate.
Send me a note if you need any help. I run dfwgate.ampr.org.

: looking for documentation for the basic protocols used in packet radio.
: low level here, not your tnc command set.
: an internet site would be most convenient.

The primary source would be in the annual ARRL Amateur Radio Computer Networking Conference proceedings. The ARRL also has a publication entitled AX.25 Amateur Packet Radio Link-Layer Protocol. There are abbreviated descriptions of the protocol in the ARRL Handbook and the Gateway to Packet Radio Book.

The info might be available on line. The ARRL has a landline BBS, but I don't know the number, or whether it is accessible from Internet. Call the ARRL at 203-666-1541 for more info.

: Also, I think it is Bell 202? isn't there a small chip that will generate the
: tones from a data stream?

It is Bell 202. The TCM3105 chip is a low power chip that is used in the Baycom and Poor Man's Packet modems. There is another chip, the 7910, that is used in some designs. I think it has a greater power requirement, but is much more flexible and can support several modes of operation.

Most / All of the NOS source files have ax25.c that handles the ax.25 stuff
in software. The LAPB.C code also handles the cross-port digi-peating.
Nothings documented very well, but it's all there. NOS talks to the TNC in
KISS mode and handles all the AX25 stuff. You can get the NOS source from
ftp.ucsd.edu.

Yes, the orientation is flipped if you use the other sideband.

On upper side band, the lower tone frequency is at the lower hf address.
higher tone frequency is at the higher hf frequency.

On lower side band, the lower tone frequency is at the HIGHER hf address.
higher tone frequency is at the LOWER hf frequency.

I forget which is mark and which is space.

: Is the MFJ 1278B a good TNC for HF/VHF?

: What about Kantronics, which one is good for around $290? tnx de N0ZYA

I have an MFJ-1278 and do not recommend it. Its factory firmware defaults left something to be desired, but more importantly, I have found the modem performance on both HF and VHF to be inferior to that of a friend's AEA PK-232MBX hooked up to the same equipment (rig, antenna, etc.). I have heard that the Kantronics KAM is also a good unit though I have never had an opportunity to use it myself. Both the PK-232MBX and KAM cost around $300 last I looked through the ham catalogs.

Your best bet would be to look at these two TNCs and see which features are more important to you. The primary difference being that the KAM allows simultaneous dual-port operations and features G-TOR, which is a KAM-to-KAM communications mode. The PK-232MBX, on the other hand, offers a bandpass filter and TDM reception for SWLing.

Source record: 46067

I am assembling a TexNet NCP to be used as a weather server. This will connect to the NWS wire and deliver weather info including RCM (Radar Coded Messages) from the WXR-88D NexRad radar.

The missing link in this system is the disk controller card. It's really a bit of a Dinosaur. These controllers may have been used in CP/M machines such as a Kaypro, or Xerox 820, or perhaps a Radio Shack Model 3. Here's what I need. I would appreciate any leads.

Western Digital # WD-1002-05g. It measures 5.75 x 8". J1, J2 and J3 are 20 pin IDC connectors for the MFM data. J7 is the control cable for the hard drive and is a 34 pin.
J-5 is a 40 pin interface for the CPU. This is NOT a PC type controller.

If I can't find one of these cards, we just can't make the weather server work. It would take a re-write of the system code.

73, and thanks!

You must have gotten the source code rather than the executable. I'll try
to find the place where I got my version and let you know where it was.
There are two files that are needed. One sets up the environment and the
other is the exe of the version you wish to use. I knew of an ftp site
but it doesn't seem to be available anymore or may be done for service.
I'll get back to you later with an address or you can look at
ftp.ucsd.edu or pc.usl.edu . Later..

Source record: 46068

My interest is the field of data communications on HF. I am looking for any information on data communications standards and protocolls in use on HF. I have already obtained the Radioteletype Code Manual published by Klingenfuss in Germany, that has info on the standard modes (e.g. FEC-A, SITOR, etc.). My particular interest is in the Piccolo/Coquelet type transmissions, some of which can be heard down here. If anyone out there has any information, or knows of other books with such info, or knows of an appropriate news group, or ftp site, etc, I would much appreciate hearing from you.

Thanks in advance,

Andries Herholdt, aherhld @ iaccess.za

It can be obtained from the anonymous ftp site ftp.funet.fi
You will need to get first v 5.15 (one zip file) and the update to v5.15c
(also one zip file). If memory serves me correct they are in the
/pub/ham/packet/bbs/f6fbb directory, but it may be worth your while to
first get a copy of the 00Index.all files from the /pub/ham directory. It is
70k in size and lists *ALL* the software available at the site, as well as
the relevant directory paths.

AS I understand the KISS interface, there is no concept of flow control.
The idea is that if the buffer overflows, the frame is lost, which isn't
(in principle) any different from the frame getting lost thru more
conventional means (ie being trashed over the air).

From: ferrett@werple.apana.org.au
Message-ID: <3c9ein$fnq@werple.apana.org.au>
Source record: 46081

Dear all

I have been using packet for a while now and also recently got a dial up slip connection and have started playing with cello and mosaic. These are yummy programs.

I noted that these programs work by directly sending tcpip packets to the internet. It occurred to me that this is similar/same as the way that programs such as ka9q send packets into the amateur packet radio network.

What I am interested in knowing is this... is it possible to somehow interface mosaic or cello so that these tcpip programs can be used over packet radio. Whilst I appreciate that with our current bit rates the system woudl be slow, at 9600 baud it might just be workable and would give superior graphics and presentation.

If it could somehow be done then we might see the situation where http directories could be set up around the amateur packet radio network thus improving access for everybody.

As I have only a basic understanding of tcpip can someone advise whether its possible and if so how?

Cheers Peter

4644. 9600 Baud Packet Modem question

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-09 16:06:22 UTC
From: joseb@talgo.eng.hou.compaq.com
Message-ID: <D0Jwqn.JxA@twisto.eng.hou.compaq.com>
Source record: 45956

I have a question concerning 9600 baud packet.

Are the modems being used in this mode using v.29 modulation (9600 baud FAX modulation standard)?

If so is there any software that will use a PC FAX card to drive a radio?

Since there are many out there with 9600 baud FAX cards, I thought this might be an inexpensive way to get on the air.

Thanks

Jose Barandiaran

Next to performing an nslookup on a particular address, try the following:

ftp ftp.ucsd.edu:/hamradio/ampr.org

4646. Other Amateur Radio TCP/IP Groups?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-09 16:29:52 UTC
From: strohs@coho.halcyon.com
Message-ID: <3ca0m0$cog@news.halcyon.com>
Source record: 46085

The Pacific Northwest Amateur Radio TCP/IP Group would like to make contact with other Amateur Radio TCP/IP groups in the US and Internationally. (TCP/IP group, as used here, is that your Amateur Packet Radio network uses TCP/IP primarily as opposed to AX.25, ROSE, Net/ROM, etc.)

We're especially interested in groups that have a fulltime Internet gateway so we can start exchanging e-mail mailing list messages, arrange FTP privileges, and just generally "broaden our horizons" a bit from just the local user base.

I know that there is a big TCP/IP user base in Victoria and Vancouver, BC, and Ottawa, ON, but I don't have any current contact info.

I'm pretty sure there is substantial TCP/IP activity in Colorado and Chicago, but again, don't have any current contact info.

ANY information is appreciated!

Thanks,

Steve Stroh N8GNJ

From: jilek@badlands.NoDak.edu
Message-ID: <D0K8EB.CLB@ns1.nodak.edu>
Source record: 45941

Sorry if this is a common question asked! But I really want to know if it is possible to use a HP48 for packet operation. It seems likely that it would work but maybe the question is how practical it is. If anyone could provide any information that they may have on how to do this it would be greatly appreciated. I have a Kenwood TH22AT and a HP48SX.

Once again thanks!

This was all the info in your message... Not a lot I can do with that HIHI

Think I know what memory problem you have.. Even though your Kam+ has 100K
memory you will not be able to load a file that large into it on a one shot
basis.. It will only allow 30k upload then it will shut off.. this was a
built in thing that you probably can't by pass.. It is trying to stop you
from tying up freq. for to long.. Hope that helps 73 AD4RR

Source record: 45945

Ok got the rest of message this time.. You will find that the kam resets
but doesnot put in parameters when you basiclly boot back to cmd: prompt..
It is up to your soft ware to do this. You will have to shut the kam
off.. then turn it back on and then bring up your operating program.. If
you have furthere problems than those mentioned then it could be bad chip
set.. That will mean return to factory for replace.. 73 Ray AD4RR

Date: 1994-12-09 22:28:55 UTC
From: rkarlqu@scd.hp.com
Message-ID: <3caln7$9oa@hpscit.sc.hp.com>
Source record: 45942

There was a discussion last month in this group about an article
in 73 magazine describing "Pulsed VPSK" modulation. The
consensus was that it was a bunch of nonsense. This month
in the Nov. 1994 "Microwaves and RF" magazine supplement called
"Wireless System Design" (pp23-29), there is an article on
VPSK using single sideband FM with suppressed carrier. The whole
thing sounds like a snow job to me, but maybe there is some beef
in there somewhere. The article seems to repeal Shannon's law.
Another red flag is: what the heck is SSB-SC-FM anyway? To me,
that is an oxymoron. Anyone else have an opinion on this?
Anyone know who these guys at Pegasus Data Systems are or what they
are trying to prove?

4663. Motorola Flexar for packet?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-10 06:31:40 UTC
From: peterson@physc3.byu.edu
Message-ID: <1994Dec9.233140.1921@physc3.byu.edu>
Source record: 45953

I have a Motorola Flexar radio that I would like to attach to a TNC for packet operation. The radio has a terminal strip across the back that brings out PPT and microphone inputs but doesn't seem to include an audio output. Hence, two questions:

1. Where is a good place to pick off the audio to feed to a TNC?

2. A first attempt at using the PTT and mic inputs on the terminal strip resulted in not keying the transmitter. If I short the PTT to ground it only supplies something like 10 mA through my ammeter but the TNC doesn't seem to be able to handle that. Am I overlooking something simple or should I suspect that my TNC is broken?

Anyone who can help out with these two questions I would grealy appreciate your input.

Thanks in advance (many times over) and 73,

Bryan Peterson

Unfortunately not, although some work has been done in Japan using FAX modem standards. The "training" sequence would be a problem.

The methods used were developed by K9NG and have also been adopted by G3RUH and others as a "standard" of sorts.

4669. Re: check sums on packets

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-10 18:21:20 UTC
From: johnl@clark.net
Message-ID: <3ccrj0$rkk@clarknet.clark.net>
Source record: 45984

Ken Thompson (kthompso@WichitaKS.NCR.COM) wrote:
: The ax.25 document says to use the HDLC method for generating and checking
: frame check sums. Who has info. on that?
: Ken.thompson@wichitaks.ncr.com

It is the standard X.25 FCS (frame checking sequence).

Here is the description from X.25:

The FCS shall be a 16-bit sequence. It shall be the ones complement
of the sum (modulo 2) of:

1) The remainder of x**k (x**15 + x**14 + x**13 + ... + x**2 + x + 1)
divided (modulo 2) by the generator polynomial x**16 + x**12 +
x**5 + 1, where k is the number of bits in the frame existing
between, but not including, the final bit of the opening flag and
the first bit of the FCS, excluding the bits inserted for
transparency, and

2) the remainder after multiplication by x**16 and then division
(modulo 2) by the generator polynomial x**16 + x**12 + x**5 + 1,
of the content of the frame, existing between but not including,
the final bit of the opening flag and the first bit of the FCS,
excluding bits inserted for transparency.

As a typical implementation, at the transmitter, the initial remainder
of the division is preset to all 1s and is then modified by division
by the generator polynomial (as described above) on the address,
control and information fields; the 1s complement of the resulting
remainder is transmitted as the 16-bit FCS sequence.

At the receiver, the initial remainder is preset to all 1s, and the
serial incoming protected bits and the FCS, when divided by the
generator polynomial, will result in a remainder of 0001110100001111
(x**15 through x**0, respectively) in the absence of transmission
errors.

From: treit@seanet.com
Message-ID: <treit.106.001649B1@seanet.com>
Source record: 45969

Hello

Forgive me if this is a common question.

I do not currently have a packet station, though I plan to set one up shortly.
I would like to be able to send email from my Internet account to my friends
on packet. How is this accomplished?

For example, a friend of mine tells me his packet email address is
N7YGE@N7SFP. Can this be translated into an address that I can send to from
Internet?

Please post or email responses.

Thanks!

-Mike KB7QOP

From: dlehnen@firefly.prairienet.org
Message-ID: <3ce7i8$ghd@vixen.cso.uiuc.edu>
Source record: 45970

Hi, I am running Paket 6.1 with a KPC-3. When someone uses "finger" on a
local tcp-ip station my Paket61 program thinks it's connecting to me.
The TNC does not show a connection, but Paket does. When this happens
it starts my log file and logs everything received over the air.
I joke about it to my friends..don't talk about me while I'm at work,
I'm always monitoring! But seriously has anyone encountered this problem
with Paket??

Steve,

TCP/IP is the big growth area of activity here in Atlanta. We have converted our 56KB backbone to JNOS which is supporting both AX.25 and TCP/IP traffic.

We all have Internet accounts through several systems: my BBS has UCP Inet connectivity, so it provides Email for everyone who doesn't have a SLIP or PPP account. The guys who really are active with TCP/IP have accounts on radio.org, a system run by a ham here in Atlanta. Correspond with Randy Jarrett, WA4MEI (rsj@wa4mei.radio.org) for more info on who he supports directly.

We are within a month of adding Inet access to our packet backbone. The node is located on-campus at Georgia Tech, who is THE Internet connect point for the region. We will initially have UCP services only via 56kb packet, with experimentation continuing on other modes.

I look forward to hearing more from you.

About the best around is the shareware program zterm, included with modems
such as the Global Village products. zterm has simple macros, and great
performance. There's a new rev of zterm (1.0b3) floating around.

Well, I finally got my old 8088 back from my brother, who finally managed to upgrade. I'm setting it up as a packet station, and I'm looking for good software. I'm using a Kantronics KPC-3. I saw a free/share-ware program once that would monitor multiple streams, etc., with 640k and CGA. Anyone know where I could find this? I can't remember what it was called.

I do have the SimTel repository on CD-ROM and it's got some good term stuff, but is there another site somewhere else that has a bigger selection of ham materials?

Thanks!

Peter, it is indeed possible and I have done it as I believe a handfull
of others have too.

You have one of two routes to give it a try.

ONE - Using the Linux operating system with AX.25 compiled into the
kernel. This is how I first managed to use Mosaic over packet. You
can learn more about Linux from the USENET newsgroups

comp.os.linux.*

and from the web

http://sunsite.unc.edu/mdw/mdw.html

TWO - Using MS Windows using the etherax.com driver and Trumpet
winsock.

BOTH methods have Mosaic and its server (httpd) avaiable freely.
It's just up to you to gather the building blocks and piece them
together.

I plan to document how to do all of this over the Christmas break.
If you have questions I'd be glad to help out.

Pete, the best place to go is to read Terry Dawson's NET-2/NET-3
HOWTO. You can get it from

sunsite.unc.edu /pub/linux/docs/HOWTO

In it Terry explains how to upgrade your kernel, where to get the
AX.25 code and how to compile it all together. Then he explains
how to configure it all.

This should get you started. Any questions, I'd be glad to help.

It seems to me that this would be *extremely* slow ('course you might've
been using it on 9600 packet). But would you please post your guide here
when you get it written?

```
: ... This month
: in the Nov. 1994 "Microwaves and RF" magazine supplement called
: "Wireless System Design" (pp23-29), there is an article on
: VPSK using single sideband FM with suppressed carrier. The whole
: thing sounds like a snow job to me, but maybe there is some beef
: in there somewhere. The article seems to repeal Shannon's law. ...

I haven't read that article yet, but did you read the lead article
"Push-Pull Amplifier Stages Quell Receiver Intermodulation Problems"?
It claims that using a push-pull stage reduces third-order IMD.

In reality, a push-pull stage can suppress even order products,
but not odd-order. The funny thing is, figures 3 and 7 (plots of
distortion products versus input level for single-ended versus
push-pull amplifiers) show that exact thing.

4691. ### Packet & Landline Modem BBS... What s/w are there?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-12 05:08:45 UTC
From: s2202629@np.ac.sg
Message-ID: <3cglst$50j@nova.np.ac.sg>
Source record: 45904

I have spent quite a bit of my time setting up a dialup (landline) BBS with s/w that is dedicated for this purporse (ie: For dialup modems).

1)I will be getting licenced RSN, and plan to get into Packet - how I will be doing this is by homebrewing a Baycom type modem (with a TCM3105), and would like to know if this packet modem can emulate a landline modem, such that I can setup a node 2 with the effect of : Node 1 65-xxx-xxxx <phonehumber>, Node 2 145.550Mhz.

I work on a MS-Dos platform.

2)If that is not possible, i'm prepared to scrap my dialup BBS setup, and find s/w which will allow me to do the above.

I would appericiate tips/suggestions for either 1) or 2).

4692. W.L.R.B. news chanses

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-12 06:55:43 UTC
From: cb1wlu@cbpackhv.xs4all.nl
Message-ID: <gate.LZy8wc1w165w@cbpackhv.xs4all.nl>
Source record: 45989

Hello everybody, i have made some chanses in the world wide distribution
of our World Link RTTY Bulletin that was send to radio.amateur.digital.misc.
We have some replay from persons that don't like to see Dutch messages in a
World wide distrubution. Particular the digital sector is not for bulletins
so they say. So from now on the World Link RTTY Bulletin will only send to
radio.amateur.rtty.dutch We now that there are many people from Holland
all over the world, and they like to read for exchanse between all the
explosion of Englisch messages also the Dutch bulletins.

We have also some nice replay from the USA on our bulletins so we like to
go on with it... For now we wish all the people all over the world, and
particular the dutch friends.. make fun and all the best from holland....

And..... with a view weeks... Mary Chrismas and a Hapy New Year 1995 to
all of you.. From Weit, PA3ESF / CB1WLU@CBPACKHV.XS4ALL.NL

Hallo allemaal, ik heb enkele wijzigingen in de wereld wijde distributie
van ons World Link RTTY Bulltin aangebracht dat werd verstuurd via
re.radio.amateur.digital.misc. We hebben hier enkele reakties van lieden
die vinden dat een Nederlands bulletin niet thuishoort in een wereld wijd
netwerk.. Vooral uit de hoek van Digital schijnen er problemen mee te zijn.
Daarom zal vanaf nu het World Link RTTY Bulletin alleen worden verzonden
via rec.radio.amateur.rtty.dutch. Wij weten dat er veel mensen uit
Nederland afkomstig zijn over de hele wereld.. en dat die het fijne vinden
eens een Nederlands bulletin aan te treffen tussen de lawine van Engels.

We hebben een paar leuke reaktie gehad uit de USA op onze bulletins, daar-
om willen wij er graag mee doorgaan.. Wij wensen voor nu alle mensen waar
ook ter wereld en in het bijzonder de Nederlandse vrienden, maak plezier
en de aller beste groeten vanuit Nederland. En .... met een paar weken...
Een heel gelukkige Kerst en een Gezegend nieuw jaar 1995 van Weit, PA3ESF

Here are some references and other pointers to Piccolo/Coquelet:

There has recently been some interest in the British
PICCOLO system and its French derivative COQUELET.

PICCOLO was developed back in 1957 by a team lead by
J.D. Ralphs at the Diplomatic Wireless Service, which
today is called the Communication Engineering Department
of the British Foreign and Commonwealth Office. The
PICCOLO equipment has gone through several complete
redesigns. The first equipment occupied a major part of
a standard 19 inch rack, while today's unit, PICCOLO Mk 6,
which is made by RACAL and is commercially available as
LA 1117 is a rather small unit by comparison.

PICCOLO is still in use by the British Foreign Office as
its main HF communication mode and several frequencies
are daily active for this purpose on HF bands.

PICCOLO and its development has been described in detail
in several publications, the first article appeared in 1963.

1) H.K. Robin, D. Bayley, T.L. Murray and J.D. Ralphs,
"Multitone signalling system employing quenched
resonators for use on noisy radio-teleprinter
circuits", Proceedings of I.E.E., Vol. 110, No. 9,
September 1963, pp. 1554-1568.

2) D. Bayley and J.D. Ralphs,
"Piccolo 32-tone telegraph system in diplomatic
communication", Proceedings of I.E.E., Vol. 119, No. 9,

September 1972, pp. 1229-1236.

3) J.D. Ralphs,
"The application of m.f.s.k. techniques to h.f.
telegraphy", The Radio and Electronic Engineer,
Vol. 47, No. 10, October 1977, pp. 435-444.

4) J.D. Ralphs,
"An improved 'Piccolo' m.f.s.k. modem for h.f.
telegraphy", The Radio and Electronic Engineer,
Vol. 52, No. 7, July 1982, pp. 321-330.

5) J.D. Ralphs,
"Principles and practice of multi-frequency
telegraphy", (book), Peter Pelegrinus on
behalf of The Institute of Electrical Engineers,
Peter Pelegrinus Ltd., London 1985,
ISBN 0-86341-022-7.

There have as well been a few non-technical articles on
PICCOLO and COQUELET in Monitoring Times.

6) Jack Albert,
"Just When You Thought It Was Safe to Turn on the
Radio", Monitoring Times, February 1989, page 47.

7) Jack Albert,
"U.S. Hobbyist First to Copy Piccolo",
Monitoring Times, July 1989, page 47.

8) Jack Albert,
"Piccolog", Monitoring Times, August 1989, page 47.

9) Jack Albert,
"A New Piccolo System", (The French Coquelet System)
Monitoring Times, March 1990, page 47.

The only decoder available on the market that can decode
both PICCOLO and COQUELET is CODE3 from HOKA Electronics,
The Netherlands, equipped with the PICCOLO and COQUELET
options.

Think about getting an HF amateur license and trying them out. You might
find the usage of the various modes varies dramatically from that which
is claimed by a particular mode's supporter.

> >

I missed the beginning of this thread, but having gone through setting up
a local IP router in this part of the country,I can hopefully add some
value.

X1J does indeed support AX25 digipeating, IP routing and Net/Rom routing. It
also has an internal BBS. All these features can be enabled or disabled as
required by the sysop. All parameters can be set/reset remotely using AX25.

You can ping the IP address of the router, but not telnet to it.

Normally it is installed on a site with good coverage and setup to do IP and
Net/Rom routing only. Any router needs to know where to forward packets to
and from and this is setup using the IProute command, with ARP add commands
to add the AX25 station callsign. Remember that IP traffic is encapsulated
inside AX25 packets, so the router needs to know not only the IP address of the
station, but also its AX25 Callsign with SSID.

What you need to do is to find out what the other stations that use the
router have as their default ip route.

You need to set up your default route to chuck everything that you dont have
a direct route to, to the router. Depending upon which version of NOS you're
using somethine along the following lines should do.

Net> route add default tnc0 44.xx.xx.xx ; where tnc0 is the name of the
interface you have. (144 and 432 are common over here) and the ip address
(44.xx.xx.xx) is that of the router. You also need to have an ARP entry
for your callsign as well.

ARP add 44.yy.yy.yy AX25 G3WYW-7 DG; where 44.yy.yy.yy is YOUR ip address
and G3WYW-7 is your hamcallsign with whatever SSID you use on that port.

X1J really comes into its own when is it given a range of IP addresses to route. If you were a local node that handled ip routing for a number of users, then the routing table for the X1J would be setup something like this

route add 44.131.6.160/28 AX25 44.131.6.4; whereby the range of ip addresses from 160 to 192 (/28 says mask from bit 28 to 31) are forwarded to 44.131.6.4

Hope this helps. If you need more specific help, then mail me direct.

We just had a store called Micro Center open here in Houston, TX. It has the BEST technical bookstore I have ever seen. You will not believe the quality and quantity they have available. Lest you think this is only of benefit to those in SE Texas, they have 11 other stores scattered through the US.

Their selections that I found interesting were primarily DSP and microwave stuff. They had easily 50 or more titles in each category. The stuff is pricey, but give them their due. How many people actually buy such esoteric titles?

> Subj: STAR TREK IV PACKETS
Several months ago, Harold Price, NK6K, challenged me to demodulate what he
thought might be HF packets in Star Trek IV. During the scenes where Scotty
is valiantly trying to beam both Chekov and Uhura back from the U.S.S.
Enterprise, where they have been stealing Nuclear vessel high speed photons,
Scotty is having a hard time hearing them. One of the sources of
interference is what appeared to Harold to be HF packet. Always being one
to rise to a challenge, I took on the job of doing some fancy Digital Signal
Processing footwork. Almost from the first I was certain that it must be an
HF packet since my very first demodulator attempt clearly revealed flags
before the start of a frame and end of frame was also clear. I knew it was
HDLC of some variety. Several things impeded the effort, including Scotty's
voice on top of the packets, some SSB from 20 meters was also nearly on top
of the signal. All of this had to be filtered out. I spent an hour of time
on the Cray-2 at work and used the fanciest FSK demodulator I could write
and I finally had noisy baseband signal plotted on paper in front of me. I
did my best to get an integral number of samples per baud as the signal was
very noisy, and though the bits could be made out by eye, I could tell that
it was going to take another hour of Cray-2 time to get the clock recovered
and to make good bit decisions. In a couple of places, HDLC showed me what
were clearly bit errors, and these could be done by eye as well. After the
filtering, and building a demodulator for the badly mistuned signal (it was
almost 900 Hz below `normal'), I took the bits to Phil Karn, KA9Q and he
decoded the NRZI data and proved beyond a shadow of a doubt that it was
indeed an HF amateur radio packet. It was WA8ZCN-0 sending an RR for NR-3
to N6AEZ on 20 meters. I got Bill Harrigill, WA8ZCN on the phone and he
agrees that it was probably him. Thanks Harold for the challenge and Phil
for the help.
Bob N4HY

================================================================================
Subject: more on Star Trek
From: Phil R. Karn
```

Date: Mon, 4 Dec 89 22:55:11 EST

==========

I just posted Bob's note to rec.ham-radio.packet after adding the following commentary:

[I should comment here that what Bob gave me was 9 pages of hard-copy waveform plots, representing about 360 bits at 300 baud, or about 1.2 seconds of real time. These waveforms showed the raw, unsliced output of his software FM demodulator. Using pencil, paper, ASCII chart and a copy of the AX.25 protocol spec, I first recovered the bit clock using a manual method similar in principle to that used in the WA4DSY 56k modem demodulator. That is, I marked off sampling points where the waveform slope went rapidly through zero, ie., at the center of an alternating mark - space - mark or space - mark - space sequence. From these I could extrapolate the proper sampling points on the other nearby bits consisting of mark-mark or space-space sequences.

Then I was ready to "slice" the data into digital bits, perform the NRZI decoding, and decode the bit stream into an AX.25 frame. The only really hard part of the job was discovering that Bob had printed page 3 of his waveform plots offset by about 5/8 of a bit time from the other pages; this really screwed up my clock recovery until I recognized and corrected for the jump from the A/D sample numbers Bob had printed underneath each bit cell.

One could actually write a fairly educational piece about the principles of "maximum likelihood decoding" from this exercise. For example, knowing that each byte of an AX.25 address field except the last always had bit zero set to 0, that the callsigns themselves always contained capital letters, digits or spaces (but never lower case letters, punctuation or control characters) and so on helped me to determine when I had probably made an error in decoding a particular bit, or if I was off in the bit count. Even the online callbook came in handy - I could determine if a particular callsign was valid and whether the operator was authorized to transmit packet on HF. All this illustrates the key role of redundant information in encoding information to tolerate noise and interference. (And before somebody points out that I just wrote a flame about the inefficiency of the AX.25 address field encodings, I should point out that there are *much* more efficient ways to improve performance through redundancy than by sprinkling zeros into the data in fixed locations. :-) --KA9Q]

==========

Subject: Update on Star Trek packet

From: Phil R. Karn

Date: Tue, 5 Dec 89 19:01:26 est

==========

An update on the "Star Trek IV" packet decoding project:

Last night I finished decoding the second half of the graphs N4HY gave me. I had made an earlier mistake in the interpretation of the control field. The actual control field was that of an I frame with N(S)=1,

N(R)=1, P/F=0. The Level 3 protocol ID was F0, which means "no upper layer protocol" (a very common value). My first attempt at decoding the text field yielded the following:

>Qt takes 4 program

(At that point, Scotty started talking over the packet, so I was unable to decode any further.) Since this didn't look quite right, I looked at the second byte a little closer. I found that if I flipped one weak-looking bit, I got

>It takes 4 program

which makes much more sense.

As reported earlier, the sender of the packet was WA8ZCN and the destination N6AEZ. Bob, N4HY, has confirmed that WA8ZCN was indeed very active on 20m packet until he moved to Arkansas a few years ago, but he has been unable to reach N6AEZ for confirmation as yet. Bob reports that Mr. Harrigill (WA8ZCN) was quite tickled to learn of our discovery, and that he would run right out to rent the videotape again so he could hear his callsign immortalized in the Final Frontier. :-)

Phil

From: freyder@gtetel.com
Message-ID: <3cj6ce$i1k@ceylon.gte.com>
Source record: 45902

Greetings,

I am trying to get my HTX-202 cranking with my Kantronics 9612 TNC.
I am able to "hear" stations just fine. But when the TNC transmits the
radio just "sits" there. The TX light comes on for port 1 but the
radio TX indicator and S meter are quiet.

I believe its a cable problem. I need a schematic for this ...

Can anybody help?

Thanks.
Rob.

4711. 2400+ Baud modem chips

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-13 11:00:30 UTC
From: qed@cs.tu-berlin.de
Message-ID: <3cjuse$irl@news.cs.tu-berlin.de>
Source record: 45905
Cross-posted to: comp.dsp,rec.radio.amateur.digital.misc

We are a couple of computer engineering students involved in a student's project to build a autonomously flying baloon.

For this we need some computer communication between the baloon and ground, where we have things like ultrasonic distance meters to measure the baloon's position.

We planned to use some kind of modem together with amateur radio. So what we have is some audio channel with maybe at best 4 kHz bandwidth. We need one channel "up" and one "down", so we first thought about the TCM 3105, which is used by radio amateurs. It uses FSK and unfortunately gives at best 1200 Baud, which we discovered is a bit to less for us.

Does anybody know about other modem chips, which should be easy to get, cheap, easy to use, that could fit our needs?

Thank you very much for you help -

Peter

& 6 other students

: I would like to selectivly monitor packets from a DX Cluster
: bulletin board without connecting but in a way that mimmics
: a connection so that I don't have to see every packet repeated
: to all the connected stations. During heavy usage times I
: sometimes get disconnected frequently. (It varies from a few
: minutes to hours) If I stay disconnected, and monitor
: I get the same packet repeatedly. I'd like to filter so that
: I only get each packet once. Any ideas? My tnc is the KAM

: Shel WA2UBK dara@physics.att.com

By using the BUDCALLS and BUDLIST to monitor selective stations, ie one
that is always connected to the cluster, you will eliminate any extra
stuff and only monitor what is either going to or from (or both) that
station.

: Is the MFJ 1278B a good TNC for HF/VHF?

: What about Kantronics, which one is good for around $290? tnx de N0ZYA

The PK-232 and the KAM go for around $320.00 US and the extra $30 would be a wise investment. I have the PK-232 and it, according to some, has better HF modems than the KAM. The KAM has G-TOR over the PK-232. If it's HF you want, I would recommend the PK-232 as I have used both and like the features of it more than the KAM. If you want dual port operation simultaneously, go for the KAM. Check out the features of each and make a decision. The MFJ has SSTV but IMHO is not in the same league with the other two.

: There is a station I want to telnet or FTP to (n0tzl).
: When I use FTP or TELNET I get no response from him.

<snip>

: Any suggestions ?

: Tim Daniels

The only other thing I could figure would be that the IP port is not set
up right or the domain.txt file is not right. I had the problem before
where I was forwarding mail to an AX25 BBS through another NOS station
and it would try to SMTP as the AX25 BBS had a listing in the domain.txt
file but the IP port was not set up to operate on the freq of the BBS.
even though a listing was in the forward.bbs file, because it was in the
domain.txt file, it would try SMTP rather than AX25. I had to remove it
from the domain.txt file.

Hard to say without seeing it HI. Hope you get it working.

Someone posted to one of these groups looking for a PSK modem
and possibly a 9600 baud modem. I seem to have lost the post but
I have a PacComm PSK-1 and NB-9600 along with the associated cables
power supplies etc. I am strongly leaning to the TAPR DSP kit as a
project making these modems surplus. If you are the person looking for
these modems drop me an e-mail and we can discuss a deal.

I'm also using the Timewave 59+. Very useful for HF work, both packet and voice. Also have used it for SAREX to pull out just that little bit more signal. Tried the Radio Shack unit for about 30 minutes. Not impressed. The 59+ has real noise reduction. The tone filter is very effective- you can snuggle right up to the bc stations on 40 meters- but you have to remember to turn it off before working packet!

There is a program called TNC-DOOR that can set up packet as a door on your land line BBS. Your landline callers can enter this door and (if they are pre-approved by you) can use your TNC. It automatically uses there call...
If you can't find it anywhere I have it on my BBS.

4726. TAPR Information and Internet Access

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-14 04:04:06 UTC
From: gjones@tcet.unt.edu
Message-ID: <3clqrm$j7v@hermes.unt.edu>
Source record: 45922

Periodic Announcement - TAPR Information and Internet Access

Greetings from TAPR!

TAPR can be reached via the Internet. The Automated Information Server that TAPR provides allows anyone to request information on TAPR, products, newsletters, and lots of other files. To find out more about this service, send an e-mail message to listserv@tapr.org with the subject line "Request" and the following text in the body of the message:

help (for a brief set of instructions)
index -all (for a list of all file by topic area)
get tapr taprinfo.txt (or info on TAPR)

In the above message example, "help" retrieves a brief set of instructions for info, "index -all" retrieves a list of available files by topic and "taprinfo.txt" retrieves a text file containing information on TAPR and what TAPR is all about. If you want to retrieve several text files with one message, use a separate line for each "get filename" request.

Special Interest Groups

TAPR maintains several SIGs in various areas. To get the latest list of SIG groups, send an e-mail message to listserv@tapr.org with the subject line "Request" and the following text in the body of the message:

lists (for list of mail groups on TAPR.ORG)

To request the information on any mail group, send an e-mail message to listserv@tapr.org and in the message text include:

information listname (where listname is the name of the mail group)

When you are ready to subscribe, send e-mail to listserv@tapr.org with the following command in the message text:

subscribe <list> <your name>

List should be the name of the mail list you want to join and Your Name should be both your First and Last Name.

Current SIGs include:
NETSIG Regional Networking SIG
BBSSIG BBS SIG
HFSIG SIG on HF Digital Topics

DSP DSP Software Development Forum
DSP-93 SIG for those that are building TAPR/AMSAT DSP-93 kits

---

FTP users

The TAPR Software Library is now available via anonymous FTP. You can
access the library by ftp access to 'ftp.hereford.ampr.org' in the directory
pub/hamradio/tapr. Login in as 'anonymous', with a password of
'your_account@internet_address'.

Packet Raido and TAPR is on the World-Wide-Web!

The series is accesible through the Packet Radio Home Page at this
URL:
http://bb.iu.net/infomotion/taprhome.html

http://bb.iu.net/infomotion/pkthome.html

What's here? A page of links (the Home Page), the TAPR Home Page, a page of
Packet Pioneers and Contacts, a hypertext packet primer and FAQ, and more.

Thanks to Howie, N2WX, President of Infomotion, for his support and invaluable
contributions of the TAPR page.

4727. distribution changes (2nd)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-14 06:45:38 UTC
From: cb1wlu@cbpackhv.xs4all.nl
Message-ID: <gate.RuNBXc1w165w@cbpackhv.xs4all.nl>
Source record: 45919

Hello everybody, i have made some changes in the world wide distribution
of our World Link RTTY Bulletin that was send to radio.amateur.digital.misc.
We have some replay from persons that don't like to see Dutch messages in a
World wide distrubution. Particular the digital sector is not for bulletins
so they say. So from now on the World Link RTTY Bulletin will only send to
radio.amateur.rtty.dutch We now that there are many people from Holland
all over the world, and they like to read for exchange between all the
explosion of Englisch messages also the Dutch bulletins.

We have also some nice replay from the USA on our bulletins so we like to
go on with it... For now we wish all the people all over the world, and
particular the dutch friends.. make fun and all the best from holland....
And if you like to read more Dutch info please send me a message.. Also
if you don't like it....hi.

And..... with a view weeks... Mary Chrismas and a Hapy New Year 1995 to
all of you.. From Weit, PA3ESF / CB1WLU@CBPACKHV.XS4ALL.NL

Hallo allemaal, ik heb enkele wijzigingen in de wereld wijde distributie
van ons World Link RTTY Bulltin aangebracht dat werd verstuurd via
re.radio.amateur.digital.misc. We hebben hier enkele reakties van lieden
die vinden dat een Nederlands bulletin niet thuishoort in een wereld wijd
netwerk.. Vooral uit de hoek van Digital schijnen er problemen mee te
zijn omdat dit niet voor bulletins bestemd is.
Daarom zal vanaf nu het World Link RTTY Bulletin alleen worden verzonden
via rec.radio.amateur.rtty.dutch. Wij weten dat er veel mensen uit
Nederland afkomstig zijn over de hele wereld.. en dat die het fijn vinden
eens een Nederlands bulletin aan te treffen tussen de lawine van Engels.

We hebben een paar leuke reaktie gehad uit de USA op onze bulletins, daar-
om willen wij er graag mee doorgaan.. Wij wensen voor nu alle mensen waar
ook ter wereld en in het bijzonder de Nederlandse vrienden, maak plezier
en de aller beste groeten vanuit Nederland. Wilt U meer Nedrlandse info
stuurt U a.u.b. een berichtje terug......
En .... met een paar weken... Een heel gelukkige Kerst en een
Gezegend nieuw jaar 1995 van Weit, PA3ESF

CB1WLU@CBPACKHV.XS4ALL.NL

4728. Knwd.732.dead.the.end

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-14 07:17:16 UTC
From: droy@netcom.com
Message-ID: <droyD0sHKs.60v@netcom.com>
Source record: 45920

This was my original post:

"Hello,
Has anyone here had problems with the Kenwood 732. I sent the radio back because the power output on the 2mtr side died. They had the radio for 2 days and sent it back after having, quote "Repaired APC circuits. Resoldered all joints and do corrective/preventive repairs on TRX unit and APC 023 protect mod. Full function test rx/tx GOOD. 2 mtrs po 50/12/5 Stable." unquote.

This seems to translate to "could not find the intermittent problem."

The radio worked for 3 days and now does not put out any power on the 2mtr side. It is back in the brown truck to Long Beach.
Have you had similar problems? Please let me know, I would like to suggest to the kenwood folks a plan of attack to fix this problem.

Please reply here or e-mail me. I may post your replys minus your name if you have a similar story to save the next ham radio brother (sister) a few UPS charges.
==========

I got some very interesting notes back, some defending Kenwood and some chastising them.
I was gona post some of the replys here but the bottom line as told to me by a local Kenwood repair shop is this.

Kenwood has cut the size of thier heat sinks by about 2/3.

They thought they could get away with using NO HEAT GREASE between the power modual and the sink. The thought here was "Nice machined surface on the heat sink, nice smooth service on the modules, no grease, save .002 per unit.

The problem is the module is cast not machined. This cost them an unknown amount in returns and repairs plus the bad publicity.

This is part of a reply I got back:

"Well, when Kenwood uses small heat-sinks and then forgets the no-brainer of putting thermal silicone/zinc-oxide on final power modules the suckas burn up. Obviously if you want Motorola or GE quality- guess what you buy... But on the other hand, I own 4 kenwood radios, and I've checked them all- not a spot of grease between the modules and the heatsink- so the sink stays cold and the module burns up. **HINT** rip off the cover and grease them up **NOW**!!

Another :

"I hope so. Between this whole mess, and the idiocy of their new HT (Th79) that
lacks a memory channel scan lockout feature, I have some doubts whether Kenwood
is really thinking about the Ham market, in any serious manner.

I know my next HT will probably be Yaesu. If it wasn't for the successful
741/742 - My Kenwood loyality in mobile transceivers would be lost also.

==========

The final word from the local repair shop is "get an amp and use low power
seting to talk simplex.
WONDERFUL, after spending $600.00 + on a radio you must also than spend
another $200.00 for an amp.

Does Kenwood really care about the ham business?

This will hopefully warn some of you who have out of warranty radios.

--

"I was gratified to be able to answer
promptly, and I did. I said I didn't know."

4729. tcp/ip over X1J

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-14 14:27:07 UTC
From: rapp@lmr.mv.com
Message-ID: <D0t1pp.K5K@mv.mv.com>
Source record: 45923

Trying to set up jnos and am getting very confused about routing. (yes, have the NOSintro book, but probably haven't read it enough times!)

I have a tcpip (jnos) station and a friend has another. In between us are two X1J rev 2 (with the node busy patch) netrom nodes. It seems like we could connect via AX.25, netrom, or TCPIP, or any combination of them.

Can someone with a little experience explain which is the "best" way (if there is a best way) and what is necessary to be put in his and my routing files as well as what is necessary to be added to the X1J nodes?

Also, what do we need to do to connect to the rest of the world? (the second X1J node communicates with another netrom node that is the path out of here.

Thanks alot & 73,

Larry W1HJF

Radio-amateurs de tous poils, offrez vous un superbe TNC tous modes pour Noel :

Il s'agit d'un Kantronics KAM+ (avec logiciel HostMaster II+ v3.1 pour PC)
Ses caracteristiques principales sont :

- mode KISS pour TCP/IP
- mode HOST pour divers freeware
- tous modes : packet, CW, AMTOR/PACTOR, RTTY, ASCII, AMTEX/NAVTEX, WEFAX
et bien sur le tout nouveau mode G-TOR (cf. dernier numero de
QST Magazine)
- PMS + BBS de 512 Ko extensible a 1 Mo
- aide en ligne inclue dans la ROM du TNC !
- les ports HF et V/UHF fonctionnent en meme temps, simultanement (ca il est le
seul a le faire)
- KA-Node (repeteur intelligent style 'TheNet')
- gateway HF <-> V/UHF
- possibilite de prise de controle distante par un sysop
- ... etc

HostMaster II+ est un logiciel concu par Kantronics specialement pour ce TNC
mais le KAM+ fonctionne tres bien avec TPK, Graphic Packet, PaKet 6.1 ... etc

Un essai complet de ce TNC a ete effectue dans le magazine MEGAHERTZ de Juillet 94.
Cet appareil est neuf.

Je m'en separe cause double emploi pour la moitie du prix neuf !

Alors pour Noel, avis aux amateurs de beau et fiable materiel .....

4732. 9600 Modem standard?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-14 16:58:44 UTC
From: joseb@talgo.eng.hou.compaq.com
Message-ID: <D0t8Hx.3xv@twisto.eng.hou.compaq.com>
Source record: 45927

Hi,

What modulation standard is used for 9600 baud packet?

Is it V.29?

Jose Barandiaran

joseb@twisto.compaq.com

4733. Need help hooking up PK-80

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-14 18:07:56 UTC
From: garym@alsys.com
Message-ID: <D0tBp9.L1@alsys.com>
Source record: 45928

I'm trying to hookup an old AEA PK-80 TNC to our BBS here in San Diego but can't find any documentation on it. I assume the DB-25 connector is standard modem pinouts, like the PK-88. But there is a 5 pin DIN connector for the audio input/output and PTT. Can anyone tell me which pins are for what? Sure would help to have our 220 port working on the BBS.

Thanks!

hi phil..
i've been running Internet apps on Mac with packet radio, except i chose
to stay with mactcp and use an old dos box running jnos (tcpip) software
this makes a very cheap and effective router/switch and lets you stay with
completey generic internet software on your mac or pc workstation. the
workstation has to connect to the jnos box with either a ethernet LAN
connection or ppp/slip local connection.
don't try this on 1200 baud, 9600 is still slow but if your frequency is clear
it can be fun.

Most of the time I use zterm (1.0b3) with my KAM+. Occasionally on HF I use
Kantronics' Host Master Mac software. Simple terminal software is adequate
for most packet work.

4736. Digital Signal Processors

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-14 20:29:36 UTC
From: aharper@arinc.COM
Message-ID: <9411147874.AA787452384@ccmail.arinc.com>
Source record: 45929

I'm trying to take a poll on the effectiveness of the DSP's
(Digital Signal Processors) currently out on the market.
Timewave and MFJ seem to be the popular ones out now. My
primary interest in use for a DSP would be for HF packet and
other digital modes. I would really appreciate knowing from
anyone and all who have purchased a DSP to let me know if
these things are really the cat's meow for HF digital work
or are they another juicy carrot for the desperate ham.
Please respond with the type of DSP and brand name use are
using or refering to.
Thanks Al.

>cheap, easy to use, that could fit our needs?

You can 'overclock' a TCM3105 by putting in a crystal at about 1.5 times
the specified freq. and use it at about 2400 bps.

Also it is possible to use direct FSK of the transmitter, instead of
Audio FSK (AFSK) which is what you get when you modulate an FM transmitter
with the audio tones from a TCM3105. There are several modems (also used
by radio amateurs) that give higher datarates by using FSK. One example
of a relatively simple modem is the design by the Hamilton Area Packet
Network (VE3DNL and others) that yields 4800 bps using a ternary FSK
system which has zero DC content without the use of a scrambler.
It is not a single-chip design, however.

4740. Just bought a KPC-3 BUT need help!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-14 21:25:38 UTC
From: tomsunman@aol.com
Message-ID: <3cnnsi$8ot@newsbf02.news.aol.com>
Source record: 45933

Well gang I'm new to all this and just bought a KPC-3 TNC.
I NEVER wired up anything before and I'm sitting here wondering what the heck I'm supposed to do with these cables, etc.
Please be patient with me if you would. I've got an HTX-202 I want to hook up.

In the box is one gray cable with 6 wires in it, the wires are colored. I assume these go to the DB-9 connector. Which color goes to which pin? There's another cable (black) a 2 wire job with a plug on the end for my speaker jack I assume. Does the other end of the colored cable get connected to the black one and if so which wire goes where? My problem is what gets attached to where? I understand the icom diagram is the one I should follow (there's 2 types 2AT style or the W2A style which should I use?) but I just don't understand how to wire this stuff up. It looks like I'm going to have to buy a 0.1uf cap and a 3.9 ohm resister (I've heard to use a 2.2ohm?).

I'd appreciate any help I can get, I hope there are some patient folks who may be able to help me out here. It's frustrating haveing this thing and I can't use it! E-mail prefered to save bandwidth.

73,

Tom, KB2SMS

4741. Re: Just bought a KPC-3 BUT need help!

Newsgroup: rec.radio.amateur.digital.misc

From: Gerald Schmitt <ggs@aerie.lanl.gov>
Message-ID: <3cns54$eq0@newshost.lanl.gov>
Source record: 45934

Use a 2.2 to 2.8k resistor. The Icom requires more resistance.
Use the 2AT model not the W2AT model. I used exactly this setup
until I sold the HTX recently. You actually only need three wires
to the TNC RX audio, TX audio and PTT combo and a ground. The six wire
cable I suspect is to make a cable to go to the computer. Save youself
that grief you can buy a "modem" cable at Rat Shack or Wall-Mart for
between your com port and the TNC if the computer is modern it will
usually be a 9 pin at the computer end. The TNC is 25 pins for this
connection. If you follow the Kantronics Quick Start Guide it will
save you a lot of time. If you need more help e-mail directly and
I give it a shot. 73 de Jerry KC5EGG@WB2ARS.NM.USA.NOAM

4742. jnos docs/FAQ Wanted

Any terminal program will do. But for packet some are better. I use
shareware program "Virtuoso". it is specially made for packet and uses
split screen. You will find it at ftp.ucsd.edu.

Does anyone know where I can get a pair of 4800b HAPN modems? Do they
attach to a modem disconnect header like the standard 9600b modem? Also,
you can get 9600b modems for around $100. How much do the HAPN modems
cost. Thanks.

Source record: 45840

Hello all!

A friend of mine has upgraded his F6FBB BBS software to version 5.15c.
By doing so he lost the communication with his two DRSI cards. He gets
an error message "DRSI-driver not loaded!" when he starts the computer.
Does anyone know what the problem is? It worked without any trouble
with the 5.15 version and he hasn't changed anything in the configuration.

Thank you in advance,

There is a mod for the PK-232 that changes the frequency shift from 200 Hz to 170 Hz for Amtor and PACTOR. This is a four resistor change. This makes HF Packet difficult not VHF. The VHF circuits are not affected. The PK-900 automatically changes between 200 Hz and 170 Hz depending on the mode selected. AEA will provide the "Amtor" mod at no cost if you call, write or FAX them. The kit also includes four resistors to return the PK-232 to the original configuration if desired. 206/774-5554 (voice) 206/775-2340 (FAX) P.O. Box C2160 Lynnwood, WA 98036 (Snail)

Source record: 45842

I'm thinking of getting packet back up and running after some absence.
My intentions are using plain ole packet, DX cluster, TCP/IP and perhaps
APRS - radio device may be an Aerotron Aircom-6 4-channel. I currently
have an elderly MFJ-1274, with 1988 firmware(can't remember the revision) -
Does anyone have experience with the PacComm? Would it be a worthy
replacement for the MFJ? Or, should I just upgrade the MFJ1274 to current
firmware and get the 9600 modem?
Any advice would be welcome.

Pure IP network in the SouthEastern Michigan area (detroit) extends from
Port Huron to Ann Arbor. Its a little fragmented due to local politics but
by and large it seems to work.

>

Sounds simple enough a request... 6 wire does go to DB9 connector. Speaker wire (Black with mini plug) also goes to DB9. You'll also need to get another plug, either mini or submini for your mic input to the radio. Cap and resistor will be needed. Look closely at the docs. They will tell you where to put the speaker leads on the DB9. They will also tell you where the audio output from the TNC is and those leads go to mic input on radio. Cap and resistor are for PTT circuit.
So a total of 4 wires are used 2 from black speaker wire and 2 from 6 wire colored cable. This should get you in the right direction

I am looking for the e-mail address for N1MGO (IP address coordinator
for the Eastern Mass area).

I have received mail regarding his address but none seem valid. Before I try to track down
Gordon via snail mail or phone I was wondering if anyone has
any other advice in getting an IP address for my area.

I am in the Billerica, MA area and my call is N1TML. I have the
software (JNOS) and tcp/ip stack running and only lacking the ip address.

Any help would be appreciated.

Thanks.

Rich H.

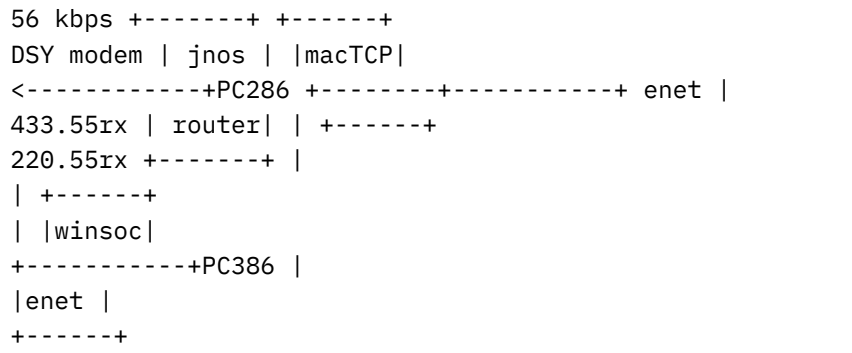
Phil Keys (philkeys@olympus.net) wrote:
: I am also interested in using Internet TCP/IP access software for
: /packet. Has anybody tried this on a Mac, i.e. replacing MacTCP with
: packet TCPIP?

The way I do it is:



The mac and windows box can both run netscape, mosaic, or
http servers, plus any other "standard" stuff. Only
icky part is that it's sometimes hard to convince the
mac or winsoc box that other stations on our lan
(radio lan that is) which are part of the Class C net
for Ottawa, are not on my ethernet. Net masking for
the winsock and mac can be tricky.

Mosaic on our 56k LAN is okay ... not anywhere near as
fast as at work, where we have 56k dedicated access to
the internet ... sharing the 56k radio lan with everyone
else in Ottawa is a bit of a pain;-)

Hello..

I'm searching a AX.25 Packet bbs to Linux with Alan Cox's AX.25 kernel patch
and Guido's SCC driver..

I dosn't use 'axl' by Alan, but i'm using 'axdrvd' by pe1ayx - Hans,
this stuff i picked up at packet..

This deamon works very good,
i can allow specified users to log into the Linux prompt..
Others is logged in as 'guest' , and a script take care if this people..

But, i'm running our local BBS (SK6BA), and this is
F6FBB BBS, KA9Q NOS and G8BPQ network node under Desqview..

It works quite good, TCP/IP<->AX.25 mail/news gateway works ok,
but i'm not quite happy with this, i want to run Linux,
not MS-DOS with Desqview.. :-

Before i can switch OS, i must have a BBS to get our Store & Forward
on the AX.25 Packet network to work first..

FBB is nice, the best thing has been a port of this software to Linux.. :)
(With a TCP/IP<->AX.25 mail/news gateway offcores.. hi ;-))

I have tried hard to find a Packet bbs,
all i have find is phone or Internet bbs's...

Can someone help me with this.. ?

9600 baud by modem is alot faster than 9600 by packet. The switching time, the collision mode of RF packet, and other sundry factors make 9600 baud packet actually more like 300-600 baud (if that much) via landline. Spread spectrum 9600 baud point to point links, 56k and beyond make much more sense for multimedia (I hate that word...) networking (Mosaic, Netscape, etc.). I'd hate to think of the clutter using these applications with the present state of packet, even at 9600 baud.

You can buy 9600 baud SS modems for $99 each surplus. Add a power amp, a good antenna and you have a great start for a moderate speed data communications system. Set up a site with a PC, several rs-232 ports using PPP/SLIP, Linux or NOS, a few modems with amps, and you could have a neat SS based BBS/Router/Gateway. Wireline ISDN access for on demand bandwidth would allow some really neat connectivity to the real world (to other systems, the Net, x.25 PSN, etc.).

Oh well, so much for dreaming. Time to get back to the real world.

I found the CuSeeMe software recently and noticed that viable video conferencing software can work with 14.4K to 100K bps. I would really like to put up a repeater (reflector in CuSeeMe terms) to allow say up to 8 hams to operate in video conferencing mode. This seems to require about 100 Kbps modems with near ethernet-like turnaround times and a repeater protocol that didn't rely on CSMA for collision passing (token ring or some sort of scheduled transmissions). Such a system would also operate as a TCP/IP LAN/WAN for the hams connected to it.

I'm sure something like this has been discussed in some forum or other and would like some pointers to groups working on such things. Any help would be greatly appreciated.

thanks in advance,

jeff, wa1hco

I have so many questions I don't know were to begin. I am 18 and am like a sponge for information. I am still in high school but I love telecommunications. But what ever my friends and I were dreaming of networking computers through airwaves and not having to worry about the phones. Then I saw this newsgroup and my dream came true. But my dream was a little off so I need help here. I have figured out that this is called packet sending and that it does though certain frequencys but I have questions like Do you need a license and how does the modems work and were can one like myself get one and how does this all work?

Also I have my own domain name(199.1.22.235)so could I set up a site, using packet and TCP/IP.

What type of computer do I need?I have a mac and an IBm and I have tried Linux

Could someone just tell me all about this. Think about it I am 18 and when I am old enough I could maybe develop this so the future of this lays in the hands of people like me. =}

Thanx a million to whoever does.

Barry, this is not right! Beware. You are taking a Part 15 device and adding a power amp will remove the type acceptance. It will no longer be under the part 15 rules and regulations. Now, you can add an antenna, but only to certain devices made during a specified time period. Look at the Part 15 rules and regs.

The other sticky point is that amateurs are only allowed 3 spreading sequences. Chances are good that these surplus modems do not use one of these codes. Thus if your idea is to add an amp and then operate under part 97, you'll still be missing the mark.

See how easy all of this is. Read your rules and regs. If you feel that they are too restrictive (which they are) then comment to your ARRL Section Manager and tell him that the rules need to be changed.

>

Until a lighting bolt hit my station and killed both the PC and the TNC
I ran TCP/IP out of an old 640K double floppy IBM Portable Computer which
is (was in this case) a XT class machine; I did it for MONTHS.

It requires to have a version of JNOS compiled for the 8088 and perhaps with
some functions stripped off but with the main protocols in (such as SMTP,
NNTP, FTP, Telnet, etc).

It was slow, but basically I used it as a router and the channel the computer
was connected to was also slow (aka the VHF 1200 AX.25 channel) so kinda you
couldn't tell the difference if you put something else faster.

My arrangement was to have my AX.25 node in other (386) machine under OS/2
with access to one TNC in one frequency; under a DOS window of the same
machine I ran one copy of JNOS.

Just to complete the picture three nodes worked on that (386) machine; this
UUCP node, the AX.25 forwarder for it and JNOS; with some other glue
software bridging stuff between each other.

I just used JNOS for no reason, any other reasonable DOS TCP/IP implementation
should have worked on the 386 since no actual AX.25 connection were made
out of the TCP/IP on that machine (problem with garden variations of TCP/IP
for DOS is the lack of a KISS driver for them, althrough there are some

fixes lately for that).

This copy had a SLIP output at 9K6 to the outside world thru a phone line and also a PLIP line connecting the machine with the slow PC-XT which in turn deliver the stuff to the Packet Radio network acting basically as a router (with the TNC hanged from the serial line and the PLIP from the paralell one).

The PLIP line is a SLIP line working thru a paralell port instead of a serial one; I implemented it thru a quick hack of a Clarksson driver and a homemade grade protocol; it behaves like a 9K6 SLIP not counting on using interrupt driven character gathering on the XT end but polling instead; counting on interrupt driven handling on both sides could yield much faster throughput than that (in the range of 100Kbps perhaps).

Other stations in the radio LAN routed stuff to me properly with no problems; even not encouraged to do so, users could TelNet/FTP/etc to the XT machine instead of the other one and besides to quickly get out because there was nothing on that machine (on my particular setup) they could work TCP/IP itself ok.

With the proper wiring to the TNC to prevent some moments of 'slowliness' I don't see why it couldn't run 9k6 out of the same configuration.

So, in a word, it works; and yes, the expert that gave you that advice knows nothing about TCP/IP implementations for DOS in general and JNOS in particular; probably some sort of *nix only guru.

I don't see why the MiniSport shouldn't work as well; if I don't recall bad this machine was similar (if not direct competition) of the IBM Portable computer I used.

Hope it helps you.
Pedro.

>
> Hi,
>
> What modulation standard is used for 9600 baud packet?
>
> Is it V.29?
>

Nope. Amateur 9600 operations are done using direct FSK. Modems supporting this are refered to as K9NG or G3RUH compatible. Basicly the data stream is 'randomized' then the square waves are 'rounded' by being passed through a sharp cutoff low-pass filter, or a lookup table and D-to-A converter is used to produce the desired transition. This signal is applied directly to an FM (not PM) modulator in the transmitter. On the receive side the signal is 'squared up' again by a data slicer and run through the same randomizer to restore the original data stream. The randomizer is present to assure that sufficient data transitions occur to prevent a frequency offset from occuring in the transmitted signal, and that sufficient data edges occur for good reconstruction of the data clock.

Some expermentation with FAX modems has been done in Japan, but the main problem is with the training cycle required so that the receiver can learn the necessary equalization for the transmitter in question. You lose all benefit of the higher speed modem with the training time required at the beginning of every transmission with the short transmissions that are the nature of packet communications.

>

Unfortunatly it's not too practical. An assumption of a telephone
is that a full-duplex circuit exists. That way the modems can interact
to establish the equalization needed to operate at that speed over a
voice-grade circuit.

Even the use of FAX modems has not gained widespread use, due to the
low performance increase for the usual short amateur transmissions
caused by the training cycle of FAX modems.

The usual nature of amateur data communications does not provide for the
full-duplex circuit. Frequently amateur communications takes on the
role of a point to multi-point scheme. All the more difficult, because
the receivers have no way to interact with the transmitter to try to
optimize the circuit. If this wasn't enough, the pre-emphasis and
de-emphasis circuitry in each radio is different, making the job
just about impossible.

Packet radio as is being described here is transmitted over radio, so,
yes you do need a license. The license is called an Amateur Radio
License and comes in several classes. There is a first step that
requires you learn some simple theory and rules and regulations. If you
tell us where you live, perhaps someone here could point you to a radio
club where they give classes in helping you get a license. It isn't very
hard to do! There's a book published by the ARRL called "Tune in the
World with Ham Radio" that you can find in many large bookstores, or you
can order direct from the ARRL, 225 Main Street (I think), Newington, CT

The tcp/ip domains that folks use here are different from what you have,
but they are similar in function. Getting a domain number is easy once
you have a license - there is a co-ordinator in your area that hands out
numbers.

If you have any other questions, just fire away! Good luck.

4775. HAM Soft via FTP

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-16 13:25:00 UTC
From: michael.jaekel@tdd.in-berlin.de
Message-ID: <941216132917163@tdd.in-berlin.de>
Source record: 45877

Here are the Help file of my new FTP Server.

Have fun with it. 73 de Michael DD6VD

```
------------------------------------------------------------
This is the HELP file for: ftp@tdd.in-berlin.de
HAM SERVER running WildCat 4.01M BBS System
------------------------------------------------------------
```

Format: All messages to ftp@tdd.in-berlin.de are processed automatically based on the keyword(s) in the SUBJECT field. All text in the body of the message is ignored.

Send your request "To:" ftp@tdd.in-berlin.de

Put the correct keyword from the list below in the "Subject:" field. The keyword must be exactly that indicated. Case is not sensitive. HELP, help or Help will work just fine. Put _just_ the keyword in the Subject: field -- nothing else (except in the case of FILE which is followed by the file name). Use a separate message request for each keyword or each file request, ONE per message only.

HELP - returns this message

INFO - returns an information message with instructions for programmers/authors who wish to upload their files to ftp@tdd.in-berlin.de

FAQ - returns a list of frequently asked questions about ftp along with the answers to those questions.

LIST - returns a list of files available from ftp@tdd.in-berlin.de

FILE <filename> - the keyword FILE followed by the requested filename from the list of available files will return the file UUENCODED in a message. The <filename> must be exactly as listed in the list of available files and include the extension (ie: GP161B.ZIP)

If you are experiencing difficulty you may send e-mail to the ftp administrator via ados@tdd.in-berlin.de

Those without e-mail access my BBS directly on DIGITAL DREAMS BBS at +49-30-382-4160 ZyXel 1496+

You may contact Michael Jaekel, SysOp of DIGITAL DREAMS at:

E-mail : ados@tdd.in-berlin.de
Fax : +49 30 3824352
Phone : +49 30 3828359
Packet : DD6VD @ DB0BRB.#BRB.DEU.EU

According to Brian Kantor's latest IP address coordinator list,
Jacques Kubley, KA9FJS, is the IP address coordinator for Indiana, yet
all attempts to contact him (by packet, by mail, by post card, by
telephone) have not been fruitful. What is the secret of getting
an IP address in the Hoosier State? Please let me know so that I
can pass this information along to a frustrated Indiana ham.

Happy Holidays,

Stan, WA1LOU

Not sure if this is the place but I thought I'd try.....

Mir (the russian space station) just made a pass over my area and
will make several more tonight. I just heard packet bursts on 145.550! I
can't wait for my radio cable to come so I can attempt to connect. Whats
the connect callsign for Mir currently? Their back on the air over the
U.S. apparently! Also, What's the shuttle uplink packet freq? I've heard
it's 144.490. I know the downlink is 145.550 (same as Mir).
Another Mir pass will occure at 01:55 ut over Dutchess county, N.Y.

Sure, just nail up a full duplex radio channel meeting the Bell C2 conditioning standard and use your telco modems. They'll train and operate just like they do over the twisted pair. Since there'll be no ring voltage, you'll have to manually take them off hook with the ATO and ATA comands, one at each end. They'll work fine until the link is broken, either by an ATH command at one end, or by dropping the radio circuit and forcing a NO CARRIER disconnect.

OTOH, they can't be used for ordinary simplex radio packet on a shared channel because they can only train with one station at a time, and they'll want to retrain and re-establish a connection every time the carrier is dropped and reasserted. Since training takes several seconds, that rather defeats the purpose of using a higher speed modem.

Don't forget the JPS filters. JPS brought DSP noise reduction to
amateur radio, and is still the only company offering two different
modes of broadband noise reduction, including spectral subtraction using
FFT techniques.

I obviously prefer the JPS equipment :-)

0. Preface

NMEA Interface Standards are intended to serve the public interest by facilitating interconnection and interchangeability of eqipment, minimizing misunderstanding and confusion between manufacturers, and assisting purchasers in selecting compatiblr equipment.

Standards are adopted by NMEA without regard to whether or not their adoption may involve patents on articles, materials or processes. By such action, NMEA does not assume any liability to any patent owner, nor does it assume any obligation whatever to parties adopting these Standards.

This Standard defines electrical signal requirements, data transmission protocol and timing, and specific sentence formats for a 4800 baud serial data bus. Each bus may have only a single TALKER but may have multiple LISTENERS.

Because of differences in baud rate and other transmission parameters, NMEA 0183 data is not directly compatible with NMEA 0180 or NMEA 0182 Standards.

Equipment that is specified by IMO to meet the SOLAS regulations is governed by the requirements of IEC doc. TC80/WG6.
The IEC Standard is aligned closely with the NMEA 0183 Standard. Where possible, differences between the two documents, and sections that pertain specifically to IEC requirements, are indicated herein by the symbol "*" in the margin.

Information on the availability of these standards will be found on the following page.

Availability and Updates of the Standard

This standard may be modified by action of the NMEA Interface Standards Comittee as the need arises.

Updates to this Standard are published periodically in:

Marine Electronics - The Official Journal of the NMEA
330 W. Canton Avenue
Winter Park, FL 32789
U.S.A.

For additional or updated copies of this standard, contact:

ENGLAND

Page 02
1. Introduction

1.1 Scope

This standard is developed to permit ready and satisfactory data communication between electronic marine instruments, navigation equipment and communications equipment when interconnected via an appropriate system.

1.2 Intended Application and Limitations on Use

This standard is intended to support one-way serial data transmission from a single TALKER to one or more LISTENERs. This is data in printable ASCII form and may include information such as position, speed, depth, frequeny allocation, etc. Typical messages might be 20 to 80 characters in length and generally require transmission no more often than once per second.

The electrical definitions in this standard are not intended to accommodate high-bandwidth applications such as radar or video imagery, or intensive databased or file transfer applications.

Since there is no provision for garanteed delivery of messages and only limited error checking capability, this standard should be used with caution in critical applications.

1.3 Definitions

1.3.1 General

Common terms are defined in Apendix IV, Glossary, of this Standard. Where there is a conflict terms shall be interpreted wherever possible in accordance with the references in Section 1.4.

1.3.2 TALKERs

A TALKER is any device which sends data to other devices within this specification. The type of TALKER is identified by a 2-character mnemonic as listed in Section 6.2 (Table 4).

1.3.3 LISTENERs

A LISTENER is any device which receives data from another device within this specification.

1.4 References

1.4.1 American National Standards Institute:
A. ANSI X 3.15 1976 ANSI Character Structure and Character Parity Sense for Serial-by-Bit Communication
B. ANSI X 3.16 1976 ANSI for Bit Sequencing of the ANS Code or Information Interchange in Serial-By-Bit Data Transmission.
C. ANSI X 3.14 1977 ANSI Code for Information Interchange

1.4.2 Electronic Industries Association Standards:
A. EIA-422-A December 1978 (CCITT X.27/V.11)

1.4.3 International Electrotechnical Commission:
A. IEC 945, Marine Navigational Equipment - General Requirements
B. IEC doc. TC80/WG6

1.4.4 American Practical Navigator, Defence Mapping Agency Hydrographic/Topographic Center, Publication No. 9, DMA Stock No. NVPUB9V1, Volumes I and II

1.4.5 Interface Control Document, Navstar GPS Space Segment/Navigation User Interface. Rockwell International Corporation Document No. ICD-GPS-200 Revision B (November 30, 1987).

2. Manufacturer's Documentation

Operator's manuals or other appropriate literature provided for equipment that is intended to meet the requirements of this standard shall contain the following information:

1. Identification of the A and B signal lines.

2. The output drive capability as a TALKER.

3. A list of approved sentences, noting unused fields, Proprietary sentences transmitted as a TALKER, and transmission interval for each sentence.

4. The load requirements as a LISTENER.

5. A list of sentences and associated data fields that are required as a LISTENER.

6. The current software and hardware revision if this is relevant to the interface.

7. An electrical description or schematic of the LISTENER/TALKER input/output circuits citing actual components and devices used, including connector type and part number.

8. The Version No. and Date of Update of the standard for which compliance is assured.

3. Hardware Specification

One TALKER and multiple LISTENERS may be connected in parallel over an interconnecting wire. The number of LISTENERS depends on the output capability and input drive requirements of individual devices.

3.1 Interconnecting Wire

Interconnection between devices may be by means of a two-conductor, shielded, twisted-pair wire.

3.2 Conductor Definitions

The conductors referred to in this standard are the signal lines "A" and "B", and shield.

3.3 Electrical Connections/Shield Requirements

All signal line "A" connections are connected in parallel with all device "A" connections and all signal line "B" connections are connected in parallel with all device "B" connections. The shield should be connected to the TALKER chassis and should not be connected at any LISTENER. However, the shield should be continuos (unbroken) between all listeners.

* A continuous DC path between TALKER and LISTENER signal grounds
* is required as provided for by EIA-422 if EIA-422 receivers are
* used in IEC applications. This path is generally part of the
* equipment safety (or chassis) grounding system.

3.4 Connector

No standard connector is specified. Wherever possible readily available commercial connectors should be used. Manufacturers

shall provide means for user identification of the connections used.

3.5 Electrical Signal Characteristics

This section describes the electrical characteristics of transmitters and receivers.

3.5.1 Signal State Definitions

The idle, marking, logical "1", OFF or stop bit state is defined by a negative voltage on line "A" with respect to line "B".

The active, spacing, logical"0", ON or start bit state is defined by a positive voltage on line "A" with respect to line "B".

Note that the above "A" with respect to "B" levels are inverted from the voltage input/output requirements of standard UARTs and that many line drivers and receivers provide a logical inversion.

3.5.2 TALKER Drive Circuits

No provision is made for more than a single TALKER to be connected to the bus. The drive circuit used to provide the signal "A" and the return "B" shall meet, at a minimum, the requirements of EIA-422-A (December 1978).

3.5.3 LISTENER Receive Circuits

Multiple LISTENERs may be connected to a single TALKER. The LISTENER receive circuit shall consist of an optoisolator and should have protective circuits to limit current, reverse bias and power dissipation at the optodiode as shown in Figure 1. Reference is made to example circuits in Section 7.0 of this Standard.

The receive circuit shall be designed for operation with a minimum differential input voltage of 2.0 volts and shall not take more than 2.0 mA from the line at that voltage.

For reasons of compatibility with equipment designed to earlier versions of this standard, it is noted that the 'idle, marking, logical "1", OFF or stop bit state' had previously< been defined to be in the range -15 to +0.5 volts. The active, spacing, logical "0", ON or start bit state' was defined to be in the range +4.0 to +15 volts while sourcing not less than 15mA.

* In places of this optoisolator receive circuit the IEC alternately
* allows the use of a differential-receiver that meets the require-
* ments of EIA-422-A (December 1978). This configuration is not
* compatible with equipment designed to meet previous versions of
* this standard that made use of single-ended unbalanced drive
* circuits.

$ $ $ $ $ $
(FIGURE 1)

Page 06
3.5.4 Electrical Isolation

Within a LISTENER there shall be no direct electrical connection between the signal line, "A", return line, "B", or shield and ship's ground or power. Isolation from ships ground is required.

3.5.5 Maximum Voltage on Bus

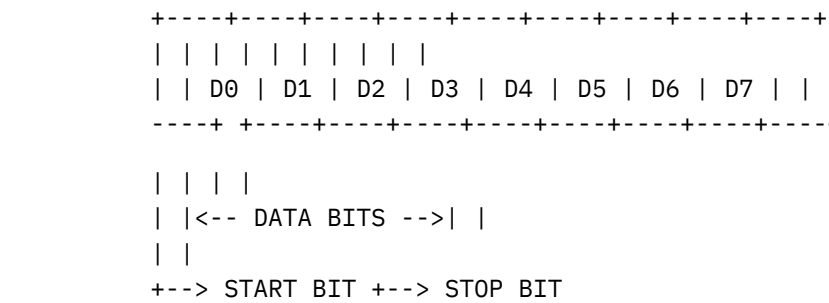
The maximum applied voltage between signal lines "A" and "B" and between either line and Ground will be in accordance with the EIA-422 specification.

For protection against miswiring and for use with earlier TALKER designes, all receive curcuit devices should be capable of with-standing 15 volts between signal lines "A" and "B" and between either line and ground for an indefinite period.

4. Data Transmission

Data is transmitted in serial asynchronous form in accordance with ANSI standards (reference paragraph 1.4.1). The first bit is a start bit and is followed by data bits, least-significant-bit first as illustrared by Figure 2. The following parameters are used:

Baud rate 4800
Data bits 8 (d7 = 0)
Parity None
Stop bits One



(FIGURE 2)

Page 07
5. Data Format Protocol

5.1 Characters

All transmitted data shall be interpreted as ASCII characters. The most significant bit of the 8-bit character shall always be transmitted as zero (d7 = 0).

5.1.1 Reserved Characters

The reserved character set consist of those ASCII characters shown in Section 6.1 (Table 1). These characters are used for specific formatting purposes, such as sentence and field delimiting, and may not be used in data fields.

5.1.2 Valid Characters

The valid character set consist of all printable ASCII characters (HEX 20 to HEX 7E) except those defined as reserved charcters. Section 6.1 (Table 2) lists the valid character set.

5.1.3 Undefined Characters

ASCII values not specified as either "reserved characters" or "valid characters" are excluded and may not be transmitted at any time.

5.1.4 Character Symbols
When individual characters are used in this standard to define units of measure, indicate the type of data field, type of sentence, etc. they will be interpreted according to the character symbol table in Section 6.1 (Table 3).

5.2 Fields

A Field consists of a string of valid characters, or no characters (null field), located between two appropriate delimiter characters.

5.2.1 Address Field

An address field is the first field in a sentence and follows the "$" delimiter, it serves to define the sentence. Characters within the address field are limited to digits and upper case letters. The address field may not be a null field. Only sentences with the following three types of address fileds may be transmitted:

5.2.1.1 Approved Address Field

Approved address fields consist of five characters defined by this standard. The first two characters are the TALKER Identifier, listed in Section 6.2 (Table 4). The next three characters form the Sentence Formatter used to define the format and the type of data. Section 6.2 (Table 5) and Appendix I list approved Sentence Formatters.

5.2.1.2 Query Address Field

The query address consists of five characters and is used for the purpose of requesting transmission of a specific sentence on a separate bus from an identified TALKER.

The first two characters are the TALKER Identifier of the device requesting data, the next two characters are the TALKER Identifi-

er of the device being addressed and the final character is the query character "Q".

5.2.1.3 Proprietary Address Field

The proprietary address field consists of the proprietary charc-ter "P" followed by a three-character Manufacturer's Mnemonic Code, used to identify the TALKER issuing a proprietary sentence, and any additional characters as required. A list of valid Manu-facturer's Mnemonic Codes is contained in Appendix III.

5.2.2 Data Fields

Data Fields in approved sentences follow a "," delimiter and con-tain valid characters in accordance with the formats illustrated in Section 6.2 (Table 6). Data fields in proprietary sentences contain only valid characters but are not defined by this stand-ard.

Because of the presence of variable data fields and null fields, specific data fileds may only be located within a sentence by ob-serving the field delimiters ",". Therefore it is essential for the LISTENER to locate fields by counting delimiters rather than counting total numbers of characters received from the start of the sentence.

5.2.2.1 Variable Length Fields

Although some data fields are defined to have fixed length, many are of variable lenght in order to allow devices to convey infor-mation and to provide data with more or less precission, according to the capability or requirements of a particular device.

Variable length fields may be alpha-numeric or numeric fileds. Variable numeric fields may contain a decimal point and may con-tain leading or trailing "zeros".

5.2.2.2 Data Field Types

Data fields may be alpha, numeric, alphanumeric, variable length, fixed length, fixed/variable (with a portion fixed in length while the remainder varies). Some fields are constant, with their value dictated by a specific sentence definition. The al-lowable field types are summarized in section 6.2 (Table 6), Field Type Summary.

5.2.2.3 Null Fields

A null field is a field of length zero, i.e. no character are transmitted in the field. Null fields shall be used when the value is unreliable or not available.

For example, if heading information were not available, sending data of "000" is misleading because a user cannot sidtinguish between "000" meaning no data and a legitimate heading of "000". However, a null field, with no characters at all, clearly indicates that no data is being transmitted.

Null fileds with their delimiters can have the following appearance depending on where they are located in the sentence:

",," ",*" ",<CR><LF>"

The ASCII NULL character (HEX 00) shall not be used as the null field.

5.2.3 Checksum Field

A checksume filed may optionally be transmitted in any sentence. However some approved sentences specifically require the checksum field. The checksum field is the last field in a sentence and follows the checksum delimiter character "*".

The checksum is the 8-bit exclusive OR (no start or stop bits) of all characters in the sentence, including "," delimiters, between but not including the "$" and the "*" delimiters.

The hexadecimal value of the most significant and least significant 4 bits of the result are converted to two ASCII characters (0-9, A-F) for transmission. The most significant character is transmitted first.

5.3 Sentences

This section describes the general structure of sentences. Details of specific sentences may specify restrictions beyond the general limitations given in this part of the standard. Such restrictions may include defining some fields as fixed length, numeric or text only, required to be non-null, transmitted with a certain frequency, etc.

The maximum number of characters in a sentence shall be 82, consisting of a maximum of79 characters between the starting delimiter "$" and the terminating <CR><LF>.

The minimum number of fields in a sentence is one (1). The first field shall be an address field containing the identity of the TALKER and the sentence formatter which specifies the number of data fields in the sentence, the type of data they contain and the order in which the data fields are transmitted. The remaining portion of the sentence may contain zero or multiple data fields.

The maximum number of fields allowed in a single sentence is limitetd only by the maximum sentence length of 82 characters. Null fields may be presented in the sentence and shall always be used if

data for that field is unavailable.

All sentences bebin with the sentence start delimiter character "$" and end with the sentence termination delimiter <CR><LF>.

5.3.1 Approved Sentences

Approved sentences are those designed for general use and detailed in this Standard. Approved sentences are listed in Section 6.3 and Appendix I of the current version of the Standard. Preferred sentences are contain in Section 6.3 and these sentences should be used wherever possible. Appendix I contains sentences that may be phased-out of use, are not recommend for new designes, but may be met in practise.

An approved sentence contains, in the order shown, the following elements:

"$" HEX 24 - Start of sentence
<address field> TALKER identifier and sentence formatter
[","<data field>] Zero or more data fields
.
.
.
[","<data field>]
["*"<checksum field>] Optional checksum field
<CR><LF> Hex 0D 0A - End of sentence

5.3.1.1 Approved Sentence Structure

The following provides a summary explanation of the approved sentence structure: $aaccc,c--c*hh<CR><LF>

ASCII HEX DESCRIPTION

"$" 24 Start of Sentence.

aaccc Address Field. Alphanumeric characters identifying type of TALKER, and Sentence Formatter. The first two characters identify the TALKER. The last three are the Sentence Formatter mnemonic code identifying the data type and the string formt of the successive Fields. Mnemonics will be used as far as posible to facilitate readouts by users.

"," 2C Field delmiter. Starts each Field except Address and Checksum fields. If it is followed by a null field, it is all that remainsto indicate no data in field.

c--c Data sentence block. Follows Address field and is a series of data fields containing all of the data to be transmitted. Data field sequences is fixed and identified by 3rd and subsequent characters of the address field (the "Sentence Formatter"). Data fields may be of variable length and are preceded by delimiters ",".

"*" 2A Optional Checksum Delimiter. Follows last Data field of the sentence. It indicates that the following two alpha-numeric characters show the HEX value of the CHECKSUM.

hh Optional Checksum Field. The absolute value calculatedby exclusive-OR'ing the 8 data bits (no start bits or stop bits) of each character in the Sentence, between, but excluding "$" and "*". The hexadecimal value of the most significant and least significant 4 bits of the result are converted to two ASCII characters (0-9, A-F) for transmission. The most significant character is transmitted first. The "CHECKSUM" field is optional, except when indicated as mandatory.

<CR><LF> 0D 0A Terminates Sentence.

5.3.2 Query Sentences

Query sentences are intended to request Approved sentences to be transmittetd from a TALKER on a seperate bus in a form of two way communication.

The approved Query sentence contains, in the order shown, the following elements:

"$" HEX 24 - Start of sentence
<aa> TALKER Identifier or requester
<aa> TALKER Identifier for device from which data is being requested
"Q" Query character identifies Query address
"," Data field delimiter
<ccc> Approved sentence formatter of data being requested
["*"<checksum field>] Optional checksum field
<CR><LF> HEX 0D 0A - End of sentence

5.3.2.1 Reply to Query Sentence

The reply on a seperate bus to a Query sentence is the Approved sentence that was requested. The use of Query sentences requires cooperation between the devices that are interconnected, a reply to a Query sentence is not mandatory and there is no specified time delay between the receipt of a query and the reply.

5.3.3 Proprietary Sentences

Proprietary sentences provide a means for manufacturers to use the sentence structure definitions of this standard to transfer data which does not fall within the scope of approved sentences. This will generally be for one of the following reasons:

-Data is intended for another device from the same manufacturer, is device specific, and not in a form or of a type of interest to the general user;

-Data is being used for test purposes prior to the adoption of approved sentences;

-Data is not of a type and general usefulness which merits the creation of an approved sentence.

A proprietary sentence contains, in the order shown, the following elements:

"$" Hex 24 - Start of sentence
"P" Hex 50 - Proprietary sentence ID
<aaa> Manufacturer's Mnemonic code
[<valid characters, manufacturer's data>]
["*"<checksum field>] Optional checksum field
<CR><LF> Hex 0D 0A - End of sentence

Beyond limiting overall sentence length are requiring the use of only valid characters, details of proprietary data fields will not be included in this standard and need not be submitted for approval. However it is required that such sentences be published in the manufacturer's manuals for reference.

5.3.4 Valid Sentences

Approved sentences, Query sentences and Proprietary sentences are the only valid sentences. Sentences of any other form are non-valid and shall not be transmitted on the bus.

5.3.5 Sentences Transmission Timing

Frequency of sentence transmission when specified shall be in accordance with the approved sentence definitions (Section 6.3 and Appendix I): When not specified, the rate should be consistent with the basic measurement or calculation cycle but generally not more frequently than once per second.

It is desirable that sentences be transmitted with minimum inter-character spacing, preferably as a near continuous burst, but under no circumstance shall the time to complete the transmission of a sentence be greater than 1 second.

5.3.6 Additions to Approved Sentences

In order to allow for improvements or additions, future revisions of this Standard may modify existing sentences by adding new data fields after the last data field but before the optional checksum delimiter character "*" and checksum field. LISTENERs should determine the end of the sentence by recognition of "<CR><LF>" and "*" rather than by counting field delimiters. The checksum value should be computed on all received characters between, but not including, "$" and "*" whether or not the LISTENER recognizes all fields.

TABLE 6 - FIELD TYPE SUMMARY

Field Type Symbol Definition

Special Format Fields:

Status A Single character field:
A = Yes, Data Valid, Warning Flag Clear
V = No, Data Invalid, Warning Flag Set

Latitude llll.ll Fixed/Variable length field:
degreed|minutes.decimal - 2 fixed digits
of degrees, 2 fixed digits of minutes
and a variable number of digits for
decimal-fraction of minutes. Leading
zeros always included for degrees and
minutes to maintain fixed length. The
decimal point and associated decimal-
fraction are optional if full resolution
is not required.

Longitude yyyyy.yy Fixed/Variable length field:
degreed|minutes.decimal - 3 fixed digits

of degrees, 2 fixed digits of minutes
and a variable number of digits for
decimal-fraction of minutes. Leading
zeros always included for degrees and
minutes to maintain fixed length. The
decimal point and associated decimal-
fraction are optional if full resolution
is not required.

Time hhmmss.ss Fixed/Variable length field:
hours|minutes|seconds.decimal - 2 fixed
digits of hours, 2 fixed digits of
minutes, 2 fixed digits of seconds and a
variable number of digits for decimal-
fraction of seconds. Leading zeros
always included for hours, minutes and
seconds to maintain fixed length. The
decimal point and associated decimal-
fraction are optional if full resolution
is not required.

Page 20
6.2 Field Definitions
(continued)

TABLE 6 - FIELD TYPE SUMMARY
(continued)

Field Type Symbol Definition

Defined field Some fileds are specified to contain
pre-defined constants, most often alpha
characters. Such a field is indicated
in this standard by the presence of one
or more valid characters. Excluded from
the list of allowable characters are the
following which are used to indicate
field types within this standard:
"A", "a", "c", "hh", "hhmmss.ss",
"llll.ll", "x", "yyyyy.yy"

Numeric Value Fields:
Variable numbers x.x Variable length integer or floating
numeric field. optional leading and
trailing zeros. The decimal point and
associated decimal-fraction are optional
if full resolution is not required.
(example: 73.10 = 73.1 = 073.1 = 73)

Fixed HEX field hh__ Fixed length HEX numbers only, MSB
on the left

Information Fields:
Variable text c--c Variable length valid character field.

Fixed alpha field aa__ Fixed length field of upper-case or
lower case alpha characters

Fixed number field xx__ Fixed length field of numeric characters

Fixed text field cc__ Fixed length field of valid characters

NOTES:

1. Spaces may only be used in variable text fields.

2. A negative sign "-" (HEX 2D) is the first character in a Filed if
the value is negative. The sign is omitted if value is positive.

3. Units of measure fields are appropriate characters from the Symbol
Table (table 3) unless a specific unit of measure is indicated.

Page 21
6.3 Approved Sentences

General format of printed sentence information:

{mnemonic} - {name}
{definition paragraph}

```
$--{sentence}
| |
| +-{field descriptions}
+-------Start of sentence and Talker ID
```

*
Designated by I.E.C. for use with I.M.O. marine electronic
devices. This is the minimum requirement for equipment that is
specified by I.M.O. to meet S.O.L.A.S. regulations.

AAM - Waypoint Arrival Alarm

Status of arrival (entering the arrival circle, or passing the
perpendicular of the course line) at waypoint c--c.

```
$--AAM,A,A,x.x,N,c--c*hh<CR><LF>
| | | | |
| | | | +---------------Waypoint ID
| | | +------------------Units of radius, nautical miles
| | +----------------------Arrival circle radius
| +-------------------------Status: A = perpendicular passed at waypoint
+--------------------------Status: A = arrival circled entered
```

ALM - GPS Almanac Data

Contains GPS week number, satellite health and the complete almanac
data for one satellite. Multiple messages may be transmitted, one
for each satellite in the GPS constellation, up to maximum of 32
messages.

```
$--ALM,x.x,x.x,xx,x.x,hh,hhhh,...
| | | | | |
| | | | | +-------e, eccentricity [3]
| | | | +-----------SV health, bits 17-24 of each almanac page [2]
| | | +--------------GPS week number [1]
| | +------------------Satellite PRN number, 01 to 32
| +---------------------Message number
+-------------------------Total number of messages

hh,hhhh,hhhh,hhhhhh,hhhhhh,...
| | | | |
| | | | +--------Omega, argument of perigee [3]
| | | +---------------SQRT(A), root of semi-major axis [3]
| | +---------------------OMEGADOT, rate of right ascension [3]
| +-------------------------(sigma) index i, inclination angle [3]
+-----------------------------t index OA, almanac reference time [3]

hhhhhh,hhhhhh,hhh,hhh*hh<CR><LF>
| | | |
| | | +-----------a index f1, clock parameter [3]
| | +---------------a index f0, clock parameter [3]
| +---------------------M index O , mean anomaly [3]
+---------------------------(OMEGA) index O, longitude of ascension node[3]
```

Page 22
Notes:

| | | | | | | +--------/Bearing origin to destination
| | | | | | +------------Status: A = perpendicular passed at waypoint
| | | | | +--------------Status: A = arrival circle entered
| | | | +----------------XTE units, nautical miles
```

```
| | | +------------------L/R Direction to steer
| | +--------------------Magnitude of XTE (cross-track-error)
| +-----------------------Status: V = Loran-C Cycle Lock warning flag
| A = OK or not used
+-------------------------Status: V = Loran-C Blink or SNR warning
V = general warning flag for other navigation
systems when a reliable fix is not available
```

```
x.x,a,x.x,a*hh<CR><LF>
| | | |
| | | +-------------------\M/T Magnetic or True
| | +---------------------/Heading-to-steer to destination waypoint
| +-------------------------\M/T Magnetic or True
+---------------------------/Bearing, Present position to destination
```

*ASD - Autopilot System Data

I.M.O. Ref. A342 (IX). Autopilot operating parameters, alarm status commanded course and vessel heading.

(TO BE DETERMINED)

BEC - Bearing & Distance to Waypoint - Dead Reckoning

Time (UTC) and distance & bearing to, and loacation of, a specified waypoint from the dead-reckoned present position.

```
$--BEC,hhmmss.ss,llll.ll,a,...
| | |
| | +-------\N/S North or South
| +--------------/Waypoint Latitude
+------------------------UTC of observation
```

```
yyyyy.yy,a,x.x,T,x.x,M,x.x,N,...
| | | | | | | |
| | | | | | | +--\nautical miles
| | | | | | +-----/Distance
| | | | | +--------\degrees Magnetic
| | | | +-----------/Bearing
| | | +--------------\E/W East or West
| | +-----------------/Waypoint longitude
| +--------------------\N/S North or South
+---------------------------/Waypoint latitude
```

```
c--c*hh<CR><LF>
|
+----------------------------Waypoint ID
```

BOD - Bearing - Origin to Destination

Bearing angle of the line, calculated at the origin waypoint, extending to the destination waypoint from the origin waypoint for the active navigation leg of the journey.

```
$--BOD,x.x,T,x.x,M,c--c,c--c*hh<CR><LF>
| | | | | |
| | | | | +--------Origin waypoint ID
| | | | +-------------Destination waypoint ID
| | | +---------------\degrees Magnetic
| | +------------------/Bearing
| +---------------------\degrees True
+-----------------------/Bearing
```

BWC - Bearing & Distance to Waypoint - Great Circle
BWR - Bearing & Distance to Waypoint - Rhumb Line

Time (UTC) and distance & bearing to, and location of, a specified waypoint from present position. '$--BWR' data is calculated along the rhumb line from present position rather than along the great circle path.

```
$--BWC,hhmmss.ss,llll.ll,a,...
| | |
| | +-------\N/S North or South
| +--------------/Waypoint latitude
+------------------------UTC of observation

yyyyy.yy,a,x.x,T,x.x,M,x.x,N,...
| | | | | | | |
| | | | | | | +--\nautical miles
| | | | | | +-----/Distance
| | | | | +--------\degrees Magnetic
| | | | +-----------/Bearing
| | | +--------------\degrees True
| | +-----------------/Bearing
| +--------------------\E/W East or West
+---------------------------/longitude

c--c*hh<CR><LF>
|
+-----------------------------Waypoint ID

$--BWR,hhmmss.ss,llll.ll,a,...
| | |
| | +-------\N/S North or South
| +--------------/Waypoint latitude
+------------------------UTC of observation

yyyyy.yy,a,x.x,T,x.x,M,x.x,N,...
| | | | | | | |
| | | | | | | +--\nautical miles
| | | | | | +-----/Distance
| | | | | +--------\degrees Magnetic
| | | | +-----------/Bearing
| | | +--------------\degrees True
| | +-----------------/Bearing
| +--------------------\E/W East or West
```

```
+---------------------------/longitude

c--c*hh<CR><LF>
|
+----------------------------Waypoint ID
```

BWW - Bearing - Waypoint to Waypoint

Bearing angle of the line, between the "TO" and the "FROM" waypoints,
calculated at the "FROM" waypoint for any two arbitrary waypoints.

```
$--BWW,x.x,T,x.x,M,c--c,c--c*hh<CR><LF>
| | | | | |
| | | | | +--------FROM waypoint ID
| | | | +-------------TO waypoint ID
| | | +---------------\degrees Magnetic
| | +------------------/Bearing
| +---------------------\degrees True
+-----------------------/Bearing
```

DBT - Depth Below Transducer

Water depth referenced to the transducer.

```
$--DBT,x.x,f,x.x,M,x.x,F*hh<CR><LF>
| | | | | |
| | | | | +---------\Fathoms
| | | | +------------/Water depth
| | | +---------------\Meters
| | +------------------/Water depth
| +---------------------\feet
+-----------------------/Water depth
```

DCN - Decca Position

Status and lines-of-position for a specified Decca chain.

```
$--DCN,xx,cc,x.x,A,cc,x.x,A,...
| | | | | | |
| | | | | | +------\
| | | | | +----------GREEN
| | | | +-------------/
| | | +---------------\ Status: Red-Master line, A = valid
| | +-------------------RED :Red Line of position (LOP)
| +---------------------/ Red Zone identifier, number-letter
+--------------------------Decca Chain identifier

cc,x.x,A,A,A,A,x.x,N,x*hh<CR><LF>
| | | | | | | | |
| | | | | | | | +---------Fix Data Basis [1]
| | | | | | | +----------\nautical miles
| | | | | | +-------------/Position uncertainty
| | | | | +-----------------Purple-line navigation use, A = valid
```

```
| | | | +-------------------Green -line navigation use, A = valid
| | | +---------------------Red -line navigation use, A = valid
| | +----------------------\
| +--------------------------PURPLE
+-----------------------------/
```

Notes:

[1] Fix Data Basis: 1 = Normal pattern
2 = Lane identification pattern
3 = Lane identification transmissions

*DPT - Depth

I.M.O. Ref. A224(VII). Water depth relative to the transducer and offset of the measuring transducer. Positive offset numbers provide the distance from the transducer to the waterline. Negative offset numbers provide the distance from the transducer to the part oft the keel of interest.

```
$--DPT,x.x,x.x*hh<CR><LF>
| |
| +--------------------Offset from transducer [1], meters:"positive" = distance
| from transducer to
| water-line
| "-" = distance from
| transducer to keel
+-------------------------Depth, meters
```

Motes:

* [1] For I.E.C applications the offset shall always be applied so as to
* provide depth relative to the keel.

*FSI - Frequency Set Information

This sentence is used to set frequency, mode of operation and trans-mitter power level of a radiotelephone; to read out frequencies, mode and power ant to acknowledge setting commands.

```
$--FSI,xxxxxx,xxxxxx,c,x+hh<CR><LF>
| | | |
| | | +----------Power level, 0 = Standby; 1 = lowest; 9 = highest
| | +------------Mode of operation [1]
| +-----------------Receiving frequency [2][3]
+-----------------------Transmitting frequency [2][3]
```

Notes:

[1] Mode of operation:
d = F3E/G3E simplex, telephone w = F1B/J2B, teleprinter/DSC
e = F3E/G3E duplex, telephone x = A1A Morse, tape recorder
m = J3E , telephone { = A1A Morse, morse key/head set
o = H3E , telephone | = F1C/F2C/F3C, FAX-machine

q = F1B/J2B FEC NBDP, TELEX/teleprinter null for no information
s = F1B/J2B ARQ NBDP, TELEX/teleprinter
t = F1B/J2B receive only, teleprinter/DSC

Page 25
[2] Frequencies to be in 100 Hz increments.
MF/HF telephone channels to have first digit 3 followed by ITU channel numbers with leading zeros as required.
MF/HF teletype channels to have first digit 4; the second ans third digit frequency bands; and the fourth to sixth digits ITU channel numbers; each with leading zeros as required.
VHF channels to have the first digit 9 followed by channel numbers with leading zeros as required

[3] For paired frequencies zhe transmitting frequency only need to be included; null for receiving frequency field. For receive frequency only, the transmitting frequency field shall be null.

GGA - Global Positioning System Fix Data

Time, position and fix related data for a GPS receiver.

```
$--GGA,hhmmss.ss,llll.ll,a,...
| | |
| | +-------\N/S North or South
| +-------------/Latitude
+---------------------UTC of position

yyyyy.yy,a,x,xx,x.x,x.x,M,...
| | | | | | |
| | | | | | +-----\Units of antenna altitude, meters
| | | | | +--------/Antenna altitude above/below mean-sea-level (geoid)
| | | | +-------------Horizontal dilution of precision
| | | +-----------------Number of satellites in use, 00-12,
| | | may be different from the number in view
| | +-------------------GPS quality indicator [1]
| +--------------------\E/W East or West
+---------------------------/Longitude

x.x,M,x.x,xxxx*hh<CR><LF>
| | | |
| | | +-------------------Differential reference station ID, 0000-1023
| | +-----------------------Age of Differential GPS data [2]
| +------------------------\Units of geoidal seperation, meters
+---------------------------/Geoidal seperation [3]
```

Notes:

[1] GPS quality indicator: 0 = fix not available or invalid
1 = GPS fix
2 = Differential GPS fix

[2] Time in seconds since last SC104 Type 1 or 9 update, null
field when DGPS is not used

[3] Geoidal Seperation: the difference between the WGS-84 earth
ellipsoid and mean-sea-level (geoid), "-" = mean-sea-level below
ellipsoid.

GLC - Geographic Position - Loran-C

Loran-C GRI, status and Time Difference (TD) lines of position for
present vessel position.

```
$--GLC,xxxx,x.x,a,x.x,a,x.x,a,...
| | | | | | |
| | | | | | +----\
| | | | | +-------/TD2 [2]
| | | | +----------\
| | | +-------------/TD1 [2]
| | +----------------\microseconds
| +-------------------/Master TOA [1]
+-------------------------GRI, microseconds/10

x.x,a,x.x,a,x.x,a*hh<CR><LF>
| | | | | |
| | | | | +-------------\Signal Status, in order of priority:
| | | | | B = blink warning
| | | | | C = cycle warning
| | | | | S = SNR warning
| | | | | A = valid
| | | | +----------------/TD5 microseconds
| | | +-------------------\
| | +----------------------/TD4 [2]
| +-------------------------\
+---------------------------/TD3 [2]
```

Page 26
Notes:

[1] Master TOA provides for direct ranging operation. It may be the
actual range to Master in microseconds or be offset and
track the arrival of the Master signal.

[2] Time difference numbers are in the Loran-C Coding Delay order
with null fields used when values are unavailable.

GLL - Geographic Position - Latitude/Longitude

Latitude and Longitude of present vessel position, time of position
fix and status.

```
$--GLL,llll.ll,a,yyyyy.yy,a,hhmmss.ss,...
| | | | |
| | | | +---UTC of position
| | | +------\E/W East or West
| | +-------------/Longitude
```

```
| +-----------------\N/S North or South
+-----------------------/Latitude

A*hh<CR><LF>
|
+------------------------------Status: A = Data valid
```

GSA - GPS DOP and Active Satellites

GPS receivers operating mode, satellites used for navigation and
DOP values.

```
$--GSA,a,x,xx,xx,xx,xx,xx,xx,...
| | | | | | | | |
| | | | | | | | +---|
| | | | | | | +------|
| | | | | | +---------|
| | | | | +------------|
| | | | +---------------|
| | | +------------------|PRN numbers of satellites used in
| | +---------------------/solution (null for unused fileds)
| +------------------------Mode: 1 = Fix not available
| 2 = 2D
| 3 = 3D
+--------------------------Mode: M = Manual, forced to operate in 2D or 3D mode
A = Automatic, allowed to automatically switch 2D/3D

xx,xx,xx,xx,xx,x.x,x.x,x.x*hh<CR><LF>
| | | | | | | | |
| | | | | | | +------VDOP
| | | | | | +----------HDOP
| | | | | +--------------PDOP
| | | | +-----------------\
| | | +--------------------|
| | +-----------------------|
| +--------------------------|
+----------------------------|
```

GSV - GPS Satellites in View

Number of SVs in view, PRN numbers, elevation, azimuth and SNR value.
Four satellites maximum per transmission, additional satellite data
sent in second or third message. Total number of messages being
transmitted and the number of the message being transmitted is indi-
cated in the first two fields.

```
$--GSV,x,x,xx,xx,xx,xxx,xx _____________ ...
| | | | | | | | |
| | | | | | | | |
| | | | | | | +-2nd - 3rd SV [2]
| | | | | | | |
| | | | | | +--------\SNR (C/No) 00-99 dB, null when not tracking
| | | | | +-----------|Azimuth, degrees True, 000 to 359
```

```
| | | | +---------------|Elevation, degrees, 90 deg maximum
| | | +-----------------/Satellite PRN number
| | +---------------------Total number of satellites in view
| +-----------------------Message number, 1 to 3 [1]
+-------------------------Total number of messages [1]

xx,xx,xxx,xx*hh<CR><LF>
| | | |
| | | +------------------\
| | +----------------------|
| +------------------------|
+--------------------------/4th SV [2]
```

Page 27
Notes:

[1] Satellite information may require the transmission of multiple messages. The first field specifies the total number of messages, minimum value 1. The second field identifies the order of this message (message number), minimum value 1.

[2] A variable number of 'PRN-Elevation-Azimuth-SNR' sets are allowed up to a maximum of four sets per message. Null fields are not required for unused sets when less than four sets are transmitted.

GXA - TRANSIT Position

Location and time of TRANSIT fix at waypoint "c--c":

```
$--GXA,hhmmss.ss,llll.ll,a,...
| | |
| | +-------\N/S North or South
| +-------------/Latitude
+-----------------------UTC of position fix

yyyyy.yy,a,c--c,x*hh<CR><LF>
| | | |
| | | +--------------Satellite number
| | +------------------Waypoint ID
| +--------------------\E/W East or West
+---------------------------/Longitude
```

*HDG - Heading, Deviation & Variation

I.M.O. Ref. A382 (X). Heading (magnetic sensor reading), which if corrected for deviation, will produce Magnetic heading, which if offset by variation will provide True heading.

```
$--HDG,x.x,x.x,a,x.x,a*hh<CR><LF>
| | | | |
| | | | +-----------\E/W East or West [2] [3]
| | | +--------------/Magnetic variation, degrees
| | +-----------------\E/W East or West [1] [3]
| +--------------------/Magnetic deviation, degrees
```

```
+-------------------------Magnetic sensor heading, degrees
```

Notes:

[1] To obtain Magnetic heading:
Add Easterly deviation (E) to Magnetic Sensor Reading
Subtract Westerly deviation (W) from Magnetic Sensor Reading

[2] To obtain True Heading:
Add Easterly variation (E) to Magnetic Heading
Subtract Westerly variation (W) from Magnetic Heading

[3] Variation and deviation fields will be null fields if unknown.

*HDT - Heading - True

I.M.O. Ref. A424 (XI). Actual vessel heading in degrees True pro-
duced by any device or system producing true heading.

```
$--HDT,x.x,T*hh<CR><LF>
| |
| +---------------------\True
+-------------------------/Heading, degrees
```

HSC - Heading Steering Command

Command heading to steer vessel.

```
$--HSC,x.x,T,x.x,M*hh<CR><LF>
| | | |
| | | +---------------\Magnetic
| | +------------------/Commanded heading, degrees
| +---------------------\True
+-------------------------/Commanded heading, degrees
```

Page 28
LCD - Loran-C Signal Data

Signal-to-Noise ratio and pulse shape (ECD) data for Loran-C
signals.

```
$--LCD,xxxx,xxx,xxx,xxx,xxx,...
| | | | |
| | | | +-------\
| | | +-----------/S1 [1]
| | +---------------\
| +-------------------/Master
+-------------------------GRI, microseconds/10

xxx,xxx,xxx,xxx,xxx,xxx,...
| | | | | |
| | | | | +--------\
| | | | +------------/S4 [1]
| | | +----------------\
| | +--------------------/S3 [1]
```

```
| +------------------------\
+----------------------------/S2 [1]

xxx,xxx*hh<CR><LF>
| |
| +------------------------\Secondary5 [1] Relative ECD, 000 to +-999
+----------------------------/Secondary5 [1] Relative SNR, 000 to 999
```

Notes:

[1] Data is in the Loran-C Coding Delay order with null fields used when values are unavailable.

MTW - Water Temperature

Water temperature.

```
$--MTW,x.x,C*hh<CR><LF>
| |
| +---------------------\degrees C
+------------------------/Temperature
```

*MWV - Wind Speed and Angle

When the Reference Field is set to Relative, data is provded giving the wind angle in relation to the vessel's headig and wind speed, both relative to the (moving) vessel.
When the Reference Field is set to True, data is provided giving the wind angle relative to the vessel's heading and wind speed, both with reference to the (moving) water. True wind is the vector sum of the Relative (Apparent) wind vector and the vessel's velocity vector along the heading line of the vessel. It represents the wind at the vessel if it were stationary relative to the water and heading in the same direction.

```
$--MWV,x.x,a,x.x,a,A*hh<CR><LF>
| | | | |
| | | | +--------------Status, A = Data Valid
| | | +---------------\Wind speed units, K/M/N
| | +------------------/Wind speed
| +---------------------\Reference: R = Relative
| T = True
+------------------------/Wind angle, 0 to 360 degrees
```

OLN - Omega Lane Numbers

Omega Lines of Positions (LOPs).

```
$--OLN,aa,xxx,xxx,aa,xxx,xxx,...
| | | | | |
| | | | | +------\
| | | | +----------|
| | | +--------------/pair 2
| | +-----------------\
```

```
| +---------------------|
+-------------------------/pair 1

aa,xxx,xxx*hh<CR><LF>
| | |
| | +---------------------\Centilane number
| +-------------------------|Lane number
+---------------------------/pair 3, AB-GH
```

*OSD - Own Ship Data

I.M.O. Ref. A477 (XII). Heading, course, speed, set and drift summary. Useful for, but not limited to RADAR/ARPA applications.

```
$--OSD,x.x,A,x.x,a,x.x,a,...
| | | | | |
| | | | | +---------\Speed Reference, B/M/W/R/P [1]
| | | | +------------/Vessel speed
| | | +---------------\Course Reference, B/M/W/R/P [1]
| | +------------------/Vessel Course, degrees True
| +---------------------\Heading Status: A = Data valid
+-----------------------/Heading, degrees True

x.x,x.x,a*hh<CR><LF>
| | |
| | +---------------------\Speed units, K/N/S
| +-----------------------|Vessel drift (speed) \ Manually
+---------------------------/Vessel set, degrees True / entered
```

Notes:

[1] Reference system: B = Bottom tracking log
M = Manually entered
W = Water referenced
R = RADAR tracking (of fixed target)
P = Positioning system ground reference

RMA - Recommended Minimum Specific Loran-C Data

Position, course and dpeed data provided by a Loran-C receiver. Time differences A and B are those used in computing latitude/longitude. Checksum is madatory in this entence. This sentence is transmitted at intervals not exceeding 2-seconds and is always accompanied by RMB when a destination waypoint is active. RMA and RMB are the recommended minimum data to be provided by a loran receiver. All data fields must be provided, null fields used only when data is temporarily unavailable.

```
$--RMA,A,llll.ll,a,yyyyy.yy,a,...
| | | | |
| | | | +----\E/W East or West
| | | +-----------/Longitude
```

```
| | +---------------\N/S North or South
| +---------------------/Latitude
+-------------------------Status: V = Blink, Cycle or SNR warning

x.x,x.x,x.x,x.x,x.x,a*hh<CR><LF>
| | | | | | |
| | | | | | +--------Checksum mandatory for RMA
| | | | | +---------\E/W East or West
| | | | +------------/Magnetic variation [1], degrees
| | | +-----------------Track Made Good, degrees True
| | +--------------------Speed over ground, knots
| +------------------------Time difference B, uS
+---------------------------Time difference A, uS
```

Notes:

[1] Easterly variation (E) subtracts from True course
Westerly variation (W) adds to True course

RMB - Recommended Minimum Navigation Information

Navigation data from present position to a destination waypoint provided ba a Loran-C, TRANSIT, OMEGA, GPS, DECCA, navigation computer or other integrated navigation system. Checksum is mandatory in this sentence. This semtemce always accompanies RMA or RMC sentences when a destination is active when provided by a Loran-C, TRANSIT or GPS receiver, other systems may transmit $--RMB without $--RMA or $--RMC.

```
$--RMB,A,x.x,a,c--c,c--c,...
| | | | |
| | | | +------------Destination waypoint ID
| | | +-----------------Origin waypoint ID
| | +------------------\Direction to steer - L/R Left or Right
| +----------------------/Cross track error - nautical miles [2]
+--------------------------Data status: V = Navigation receiver warning

llll.ll,a,yyyyy.yy,a,...
| | | |
| | | +----------\E/W East or West
| | +-----------------/Destination wpt. longitude
| +---------------------\N/S North or South
+--------------------------/Destination wpt. latitude

x.x,x.x,x.x,A*hh<CR><LF>
| | | | |
| | | | +----------------Checksum, mandatory for RMB
| | | +------------------Arrival status: A = arrivalcircle entered or perpendicular passed
| | +--------------------Destination closing velocity, knots
| +------------------------Bearing to destination, degrees True
+---------------------------Range to destination, nautical miles [1]
```

Notes:

[1] If range to destination exceeds 999.9 NM, display 999.9

[2] if cross track error exceeds 9.99 NM, display 9.99

RMC - Recommended Minimum Specific GPS/TRANSIT Data

Time, date, position, course and speed data provided by a GPS or
TRANSIT navigation receiver. Checksum is mandatory in this sen-
tence. This sentence is transmitted at intervals not exceeding 2-
secondes and is always accompanied by RMB when a destination waypoint
is active. RMC and RMB are recommended minimum data to be pro-
vided by a GPS or TRANSIT receiver. All data fields must be provid-
ed, null fields used only when data is temporarily unavailable.

```
$--RMC,hhmmss.ss,A,llll.ll,a,...
| | | |
| | | +-----\N/S North or South
| | +-----------/Latitude
| +----------------Status: V = Nav. receiver warning
+------------------------UTC of position fix

yyyyy.yy,a,x.x,x.x,xxxxxx,...
| | | | |
| | | | +---------Date: dd|mm|yy
| | | +--------------Track made good, degrees True
| | +------------------Speed over ground, knots
| +--------------------\E/W East or West
+---------------------------/Longitude

x.x,a*hh<CR><LF>
| | |
| | +------------------------Checksum, mandatory for RMC
| +------------------------\E/W East or West [1]
+---------------------------/Magnetic variation, degrees
```

Notes:

[1] Easterly variation (E) subtract from True course
Westerly variation (W) adds to True course

Page 31
*ROT - Rate of Turn

I.M.O. Ref. A526 (XIII). Rate of turn and direction of turn.

```
$--ROT,x.x,A*hh<CR><LF>
| |
| +----------------------Status: A = Data valid
+------------------------Rate of turn, degrees/minute, "-" = bow turns to port
```

*RPM - Revolutions

I.M.O. Ref. (none). Shaft or engine revolution rate and propeller
pitch.

```
$--RPM,a,x,x.x,x.x,A*hh<CR><LF>
| | | | |
| | | | +--------------Status: A = Data valid
| | | +-----------------Propeller pitch, % of max., "-" = astern
| | +---------------------Speed, rev/min, "-" = counter-clockwise
| +-----------------------Engine or shaft number, numbered from center-
| line, odd = starboard, even = port, 0 = single
| or on center-line
+-------------------------Source: Shaft/Engine - S/E
```

*RSA - Rudder Sensor Angle

I.M.O. Ref. (none). Relative rudder angle, from rudder angle sensor.

```
$--RSA,x.x,A,x.x,A*hh<CR><LF>
| | | |
| | | +---------------\Status A = Valid
| | +-----------------/Port rudder sensor [1]
| +---------------------\Status A = Valid
+-----------------------/Starboard (or single) rudder sensor [1]
```

*RSD - RADAR System Data

I.M.O. Ref. A477 (XII). RADAR screen setting data.

```
$--RSD,x.x,x.x,x.x,x.x,x.x,x.x,...
| | | | | |
| | | | | +-----Origin2 bearing
| | | | +---------Origin2 range
| | | +-------------Bearing Line 1 (EBL1), degrees from 0 deg
| | +-----------------Variable Range Marker 1 (VRM1), range
| +---------------------Origin1 bearing, degrees from 0 deg
+-------------------------Origin1 range , from own ship

x.x,x.x,x.x,x.x,x.x,a,a*hh<CR><LF>
| | | | | | |
| | | | | | +--------Display rotation [1]
| | | | | +----------Range units, K/N/S
| | | | +-------------Range scale (maximum)
| | | +-----------------Cursor bearing, degrees CW from 0 deg.
| | +---------------------Cursor range, from own ship
| +-------------------------EBL2, degrees
+---------------------------VRM2, range
```

Notes:

[1] Display rotation: C = Course-up, course-over-ground up, degrees True
H = Head -up, ship's heading (center-line) 0 deg up
N = North -up, True north is 0 deg up

RTE - Routes

Waypoint identifiers, listed in order with starting waypoint first,
for the identified route. Two mode of transmission are provided:

'c' indicates that the complete list of waypoints in the route are
being transmitted; 'w' indicates a working route where the first
listed waypoint is always the last waypoint that had been reached
(FROM), while the second listed waypoint is always the waypoint that
the vessel is currently heading for (TO), the remaining list of
waypoints represents the remainder of the route.

```
$--RTE,x.x,x.x,a,c--c,c--c,...
| | | | |
| | | | +----------Waypoint identifier
| | | +---------------Route identifier
| | +------------------Message mode: c = complete route, all waypoints
| | w = working route, 1st listed waypoint
| | is 'FROM', 2nd is 'TO' and remain-
| | ing are rest of route
| +---------------------Message number [2]
+------------------------Total number of messages being transmitted [2]

______ c--c*hh<CR><LF>
| |
| +----------------------Waypoint 'n' identifier [1]
+---------------------------Additional waypoint identifiers [1]
```

Notes:

[1] A variable number of waypoint identifiers, up to 'n', may be in
included within the limits of allowed sentence length. As there is
no specified number of waypoints, null fields are not required for
Waypoint Identifier fields.

[2] A single route may require the transmission of multipe messages.
The first field specifies the total number of messages, minimum
value = 1. The second field identifies the order of this message
(message number), minimum value = 1.

*SFI - Scanning Frequency Information

This sentence is used to set frequencies and mode of operation for
scanning purposes and to acknowledge setting commands. Scanning
frequencies are listed in order of scanning.

Note:
For DSC distress and safety watchkeeping only 6 channels shall be
scanned in the same scanning sequence.
To indicate a frequency set at the scanning receiver use FSI sen-
tence.

```
$--SFI,x.x,x.x,xxxxxx,c _______ ...
| | | | |
| | | | +-------2nd - 5th frequency, mode [3]
| | | +----------\Mode of operation [1]
| | +---------------/1st frequency or ITU channel [2]
| +---------------------Message number [4]
```

```
+-------------------------Total number of messages being transmitted [4]

xxxxxx,c*hh<CR><LF>
| |
| +----------------------\mode [3]
+---------------------------/6th frequency
```

Page 33
Notes:

[1] Mode of operation:
d = F3E/G3E simplex, telephone w = F1B/J2B, teleprinter/DSC
e = F3E/G3E duplex, telephone x = A1A Morse, tape recorder
m = J3E , telephone { = A1A Morse, morse key/head set
o = H3E , telephone | = F1C/F2C/F3C, FAX-machine
q = F1B/J2B FEC NBDP, TELEX/teleprinter null for no information
s = F1B/J2B ARQ NBDP, TELEX/teleprinter
t = F1B/J2B receive only, teleprinter/DSC

[2] Frequencies to be in 100 Hz increments.
MF/HF telephone channels to have first digit 3 followed by ITU channel numbers with leading zeros as required.
MF/HF teletype channels to have first digit 4; the second and third digit frequency bands; and the fourth to sixth digits ITU channel numbers; each with leading zeros as required.
VHF channels to have first digit 9 followed by channel number with leading zeros as required.

[3] A variable number of frequency-mode pair fields are allowed up to a maximum of six pairs. Null fields are not required for unused pairs when less than six pairs are transmitted.

[4] Scanning frequency information may require the transmision of multiple messages. The first field specifies the total number of messages, minimum value = 1. The second field identifies the order of this message (message number), minimum value = 1.

STN - Multiple Data ID

This sentence is transmitted before each individual sentence where there is a need for the Listener to determine the exact source of data in a system. Examples might include dual-frequency depthsounding equipment or equipment that integrates data from a number of sources and produces a single output.

```
$--STN,xx*hh<CR><LF>
|
+-------------------------Talker ID number, 00 to 99
```

TRF - TRANSIT Fix Data

Time, date, position and information related to a TRANSIT fix.

```
$--TRF,hhmmss.ss,xxxxxx,llll.ll,a,...
| | | |
| | | +\N/S North or South
| | +------/Latitude
| +--------------Date: dd|mm|yy
+------------------------UTC of position fix

yyyyy.yy,a,x.x,x.x,x.x,x.x,...
| | | | | |
| | | | | +------Update distance, nautical miles
| | | | +----------Number of Doppler intervals
| | | +--------------Number of iterations
| | +------------------Elevation angle
| +--------------------\E/W East or West
+---------------------------/Longitude

xxx,A*hh<CR><LF>
| |
| +-------------------------Data status: warning flag
+---------------------------Satellite ID
```

Page 34

*TTM - Tracked Target Message

I.M.O. Ref. A477 (XII). Data associated with a tracked target relative to own ship's position.

```
$--TTM,xx,x.x,x.x,a,x.x,x.x,a,...
| | | | | | |
| | | | | | +----\true/relative - T/R
| | | | | +-------/Target course, degrees
| | | | +------------Target speed
| | | +--------------\true/relative - T/R
| | +-----------------/Bearing from own ship, degrees
| +----------------------Target distance, from own ship
+--------------------------Target number, 00 to 99

x.x,x.x,a,c--c,a,a*hh<CR><LF>
| | | | | |
| | | | | +-------------Reference target = R, null otherwise
| | | | +---------------Target status [1]
| | | +-------------------User data (eg. target name)
| | +----------------------Minutes
| +-------------------------Time to CPA, "-" increasing
+---------------------------Distance of closest-point-of-approach
```

Notes:

[1] Target status: L = Lost, tracked target has been lost
Q = Query, target in the process of acquisition
T = Tracking

*VBW - Dual Ground/Water Speed

Water referenced and ground referenced speed data.

```
$--VBW,x.x,x.x,A,x.x,x.x,A*hh<CR><LF>
| | | | | |
| | | | | +--------Status: Ground speed, A = Data valid
| | | | +-----------Transverse ground speed [1], knots
| | | +---------------Longitudinal ground speed [1], knots
| | +------------------Status: Water speed, A = Data valid
| +---------------------Transverse water speed [1], knots
+-------------------------Longitudinal water speed [1], knots
```

Notes:

[1] Transverse speed: "-" = port, Longitudinal speed: "-" = astern

VDR - Set and Drift

The direction towards which a current flows (Set) and speed
(Drift) of a current.

```
$--VDR,x.x,T,x.x,M,x.x,N*hh<CR><LF>
| | | | | |
| | | | | +---------\Knots
| | | | +------------/Current speed
| | | +---------------\Magnetic
| | +------------------/Direction, degrees
| +---------------------\True
+-------------------------/Direction, degrees
```

VHW - Water Speed and Heading

The compass heading to which the vessel points and the speed of
the vessel relative to the water.

```
$--VHW,x.x,T,x.x,M,x.x,N,x.x,K*hh<CR><LF>
| | | | | | | |
| | | | | | | +---\km/hr
| | | | | | +------/Speed
| | | | | +---------\knots
| | | | +------------/Speed
| | | +---------------\Magnetic
| | +------------------/Heading, degrees
| +---------------------\True
+-------------------------/Heading, degrees
```

VLW - Distance Traveld through the Water

The distance traveled, relative to the water.

```
$--VLW,x.x,N,x.x,N*hh<CR><LF>
| | | |
| | | +---------------\nautical miles
| | +------------------/Distance since reset
| +---------------------\nautical miles
```

```
+------------------------/Total cumulative distance
```

VPW - Speed Measured Parallel to Wind

The component of the vessel's velocity vector parallel to the direction of the true wind direction. Sometimes called "speed made good to windward" or "velocity made good to windward".

```
$--VPW,x.x,N,x.x,M*hh<CR><LF>
| | | |
| | | +---------------\meters/second
| | +-----------------/Speed, "-" = downwind
| +---------------------\knots
+------------------------/Speed, "-" = downwind
```

VTG - Track Made Good and Ground Speed

The actual track made good and speed relative to the ground.

```
$--VTG,x.x,T,x.x,M,x.x,N,x.x,K*hh<CR><LF>
| | | | | | | |
| | | | | | | +---\km/hr
| | | | | | +------/Speed
| | | | | +---------\knots
| | | | +------------/Speed
| | | +---------------\Magnetic
| | +-----------------/Track, degrees
| +---------------------\True
+------------------------/Track, degrees
```

WCV - Waypoint Closure Velocity

The component of the velocity vector in the direction of the waypoint, from present position. Sometimes called "speed made made good" or "velocity made good".

```
$--WCV,x.x,N,c--c*hh<CR><LF>
| | |
| | +-------------------Waypoint identifier
| +---------------------\knots
+------------------------/Velocity component
```

WNC - Distance - Waypoint to Waypoint

Distance between two specified waypoints.

```
$--WNC,x.x,N,x.x,K,c--c,c--c*hh
| | | | | |
| | | | | +--------'FROM' Waypoint identifier
| | | | +-------------'TO' Waypoint identifier
| | | +---------------\km
| | +-----------------/Distance
| +---------------------\nautical miles
+------------------------/Distance
```

WPL - Waypoint Location

Latitude and longitude of specified waypoint.

```
$--WPL,llll.ll,a,yyyyy.yy,a,c--c*hh<CR><LF>
| | | | |
| | | | +----Waypoint identifier
| | | +------\E/W East or West
| | +-------------/Waypoint longitude
| +-----------------\N/S North or South
+-----------------------/Waypoint latitude
```

Page 36
XDR - Transducer Measurements

Measurement data from transducers that measure physical quantities such as temperature, force, pressure, frequency, angular or linear displacement, etc. Data from a variable number transducers measuring the same or different quantities can be mixed in the same sentence. This sentence is designed for use by integrated systems as well as transducers that may be connected in a 'chain' where each transducer receives the sentence as an input and adds its own data fields on before retransmitting the sentence.

```
$--XDR,a,x.x,a,c--c, _______ ...
| | | | |
| | | | +---------Data for variable # of transducers
| | | +----------------\Transducer #1 ID
| | +-------------------|Units of measure, Transducer #1 [2]
| +---------------------|Measurement data, Transducer #1
+-------------------------/Transducer type, Transducer #1 [2]

a,x.x,a,c--c*hh<CR><LF>
| | | |
| | | +--------------------\
| | +----------------------|
| +-------------------------|
+---------------------------/Transducer 'n' [1]
```

Notes:

[1] Sets of the four fields 'Type-Data-Units-ID' are allowed for an unde-fined number of transducers. Up to 'n' transducers may be included within the limits of allowed sentence length, null fields are not re-quired except where portions of the 'Type-Data-Units-ID' combination are not available.

[2] Allowed transducer types and their units of measure are:

Transducer Type Field Units Field Comments

temperature C C = degrees Celsius
angular displacement A D = degrees "-" = anticlockwise
linear displacement D M = meters "-" = compression
frequency F H = Hertz

```
force N N = Newtons "-" = compression
pressure P B = Bars "-" = vacuum
flow rate R l = liters/second
tachometer T R = RPM
humidity H P = Percent
volume V M = cubic meters
```

XTE - Cross-Track Error - Measured

Magnitude of the position error perpendicular to the intended track line and the direction to steer to reduce the error.

```
$--XTE,A,A,x.x,a,N*hh<CR><LF>
| | | | |
| | | | +---------------\Units, nautical miles
| | | +-----------------|Direction to steer, L/R Left or right
| | +--------------------/Magnitude of Cross-Track-Error
| +------------------------Status: V = Loran-C Cycle Lock warning flag
| A = OK or not used
+--------------------------Status: V = Loran-C Blink or SNR warning
V = general warning flag for other navigation
system when a reliable fix is not available
```

XTR - Cross-Track Error - Dead Reckoning

Magnitude of the dead reckoned position error perpendicular to the intended track line and the direction to steer to reduce the error.

```
$--XTR,x.x,a,N**hh<CR><LF>
| | |
| | +-------------------\Units, nautical miles
| +---------------------|Direction to steer, L/R Left or right
+-----------------------/Magnitude of Cross-Track-Error
```

ZDA - Time & Date

UTC, day, month, year and local time zone.

```
$--ZDA,hhmmss.ss,xx,xx,xxxx,xx,xx*hh<CR><LF>
| | | | | |
| | | | | +--Local zone minutes description, same sign as local hours
| | | | +-----Local zone description [1], 00 to +-13 hrs
| | | +---------Year
| | +-------------Month, 01 to 12
| +---------------Day , 01 to 31
+-----------------------UTC
```

Notes:

[1] Zone description is the number of whole hours added to local time to obtain GMT, Zone description is negative for East longitudes.

ZFO - UTC & Time from Origin Waypoint

UTC and elapsed time from origin waypoint.

```
$--ZFO,hhmmss.ss,hhmmss.ss,c--c*hh<CR><LF>
| | |
| | +-----Origin waypoint ID
| +--------------Elapsed time
+------------------------UTC of observation
```

ZTG - UTC & Time to Destination Waypoint

UTC and predicted time-to-go to destination waypoint.

```
$--ZTG,hhmmss.ss,hhmmss.ss,c--c*hh<CR><LF>
| | |
| | +-----Destination waypoint ID
| +--------------Time-to-go
+------------------------UTC of observation
```

7. Applications

7.1 Example Sentences

These examples are intended as samples of correct constructed sentences. They are representative samples only and show part of the wide range of legal variations possible with sentences. They should not necessarily be used as templates for sentences.

7.1.1 Example #1, Loran-C LAT/LONG

This example gives present position in Lat-Long, as determined by LoranC. The 3 character mnemonic in the address, GLL, indicates that the data is present position in Lat.-Long. The time (UTC) of the position fix is 09 hours, 13 minutes and 42 seconds. Decimal seconds are not available and the decimal point is optionally omitted. There are no warning flags set in the navigation receiver as indicated by Status = 'A'.

```
$LCGLL,4728.31,N,12254.25,W,091342,A*21<CR><LF>
| | | | | | | | |
| | | | | | | | +--Sentence Terminator
| | | | | | | +-------Checksum 21HEX
| | | | | | +---------Receiver status: no warnings
| | | | | +--------------Time of position fix
| | | | +-----------------\Units Designator (West)
| | | +------------------------/Long. 122 Degrees, 54.25 Minutes
| | +---------------------------\Units Designator (North)
| | +-----------------------------------/Lat. 47 Degrees, 28.31 Minutes
| +---------------------------------------Address: LC = Loran-C
| GLL = Present Position
+-----------------------------------------Start of sentence
```

7.1.2 Example #2, Loran-C Arrival Alarm

This example illustrates Arrival Alarm data. The mnemonic code for Arrival Alarm is AAM. In this case the address Field is "LCAAM" for Loran-C Arrival Alarm. The first data field shows "V" indicating the radius of the arrival circle HAS NOT been entered, the second data field is "A" showing that the perpendicular to the course line, at the destination, HAS been crossed. The third and fourth fields show the radius and units of the destination waypoint arrival circle ".15,N" for 0.15 nautical miles. Data field five is the Waypoint Identifier field of valid characters.

```
$LCAAM,V,A,.15,N,CHAT-N6*56<CR><LF>
| | | | | | | | |
| | | | | | | | +--------------Sentence Terminator
| | | | | | | +-------------------Checksum 56HEX
| | | | | | +------------------------Identifier for waypoint "CHAT-N6"
| | | | | +---------------------------\Units of arrival circle, nautical miles
| | | | +-------------------------------/Radius of arrival circle, 0.15
| | | +-----------------------------------Status: perpendicular has been crossed
| | +------------------------------------Status: arrival circle has not been entered
| +-----------------------------------------Address: LC = Loran-C
+------------------------------------------- AAM = Start of Sentence
```

7.1.3 Example #3 - Proprietary Sentence

A proprietary sentence has the following general format:

```
|<--- 80 character Sentence or less --->|
v v

$Paaa-----------------------------------<CR><LF>
|| | | | |
|| | +--> data, 75 character maximum <--+ +--> End of sentence
|| |
|| +----> 3 character manufacturer's mnemonic code
||
|+------> Proprietary sentence identifier
|
+-------> Start of sentence
```

A specific example will have little meaning to someone other than the particular manufacturer that designed the sentence:

```
$PSRDA003[470738][1224523]???RST47,3809,A004*47<CR><LF>
|| | | | | |
|| | +> any serie of valid (non-reserved) <+ | +--> End of Sentence
|| | +> characters of manufacturers choice<+ +--------> Checksum 47HEX
|| |
|| +--> Unique manufacturer's assigned code
||
|+----> Proprietary sentence identifier
|
+-----> Start of sentence
```

7.1.4 Example #4 - RMA Examples

The following group of sentences show a typical progression of
output data as a Loran-C receiver acquires stations:

a) $LCRMA,V,,,,,14162.8,,,,,*0D<CR><LF>
Data invalid, only one TD acquired. Fields where data is
not yet available are null fields.

b) $LCRMA,V,,,,,14172.3,26026.7,,,,*2E<CR><LF>
Two TDs acquired but not settled, data invalid.

c) $LCRMA,A,,,,,14182.3,26026.7,,,,*36<CR><LF>
Data valid, two TDs cycled but Lat/Lon not yet calculated.

d) $LCRMA,A,4226.26,N,07125.89,W,14182.3,26026.7,8.5,275.,14.0,W*68<CR><LF>
Normal operation

e) $LCRMA,V,4226.26,N,07125.89,W,14182.3,26026.7,8.5,275.,14.0,W*7F<CR><LF>
Data invalid, potential Loran problem.

f) $LCRMA,A,4226.265,N,07125.890,W,14182.33,26026.71,8.53,275.,14.0,W*53<CR><LF>
Loran operating in high resolution mode.

Page 40
7.1.5 Example #5 - FSI Examples

The following sentences show typical applications for remote
control of radiotelephones:

a) $--FSI,020230,026140,m,0*hh<CR><LF>
Set transmitter 2023 kHz, receiver 2614 kHz, mode J3E,
telephone, standby.

b) $CTFSI,020230,026140,m,5*11<CR><LF>
MF/HF radiotelephone set transmit 2023 kHz, receive
2614 kHz, mode J3E, telephone, medium power.

c) $--FSI,,021820,o,*hh<CR><LF>
Set receiver 2182 kHz, mode H3E, telephone.

d) $CDFSI,900016,,d,9*08<CR><LF>
Set VHF transmit and receive channel 16, F3E/G3E
simplex, telephone, high power.

e) $--FSI,300821,,m,9*hh<CR><LF>
Set MF/HF radiotelephone to telephone channel 821 e.g.
transmit 8 255 kHz, receive 8 779 kHz, mode J3E,
telephone, high power.

f) $--FSI,404001,,w,5*hh<CR><LF>
Set MF/HF radiotelephone to telephone channel 1 in 4 MHz
band e.g. transmit 4 172.5 kHz, receive 4 210.5 kHz,
mode F1B/J2B, teleprinter, medium power.

g) $CTFSI,416193,,s,0*00<CR><LF>
MF/HF radiotelephone tuned to teletype channel 193 in
16 MHz band e.g. transmitter 16 784.5 kHz, receiver

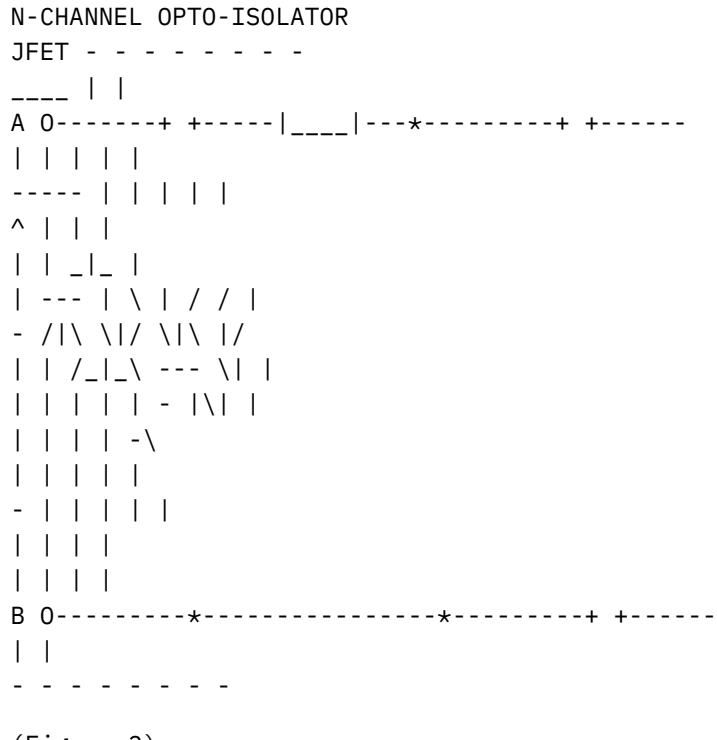
16 902.5kHz, mode F1B/J2E ARQ, TELEX/teleprinter, standby.

h) $--FSI,041620,043020,|,9*hh<CR><LF>
Set MF/HF radiotelephone transmit 4 162 kHz, receive
4 302 kHz, mode F1C/F2C/F3C, FAX-machine, high power.

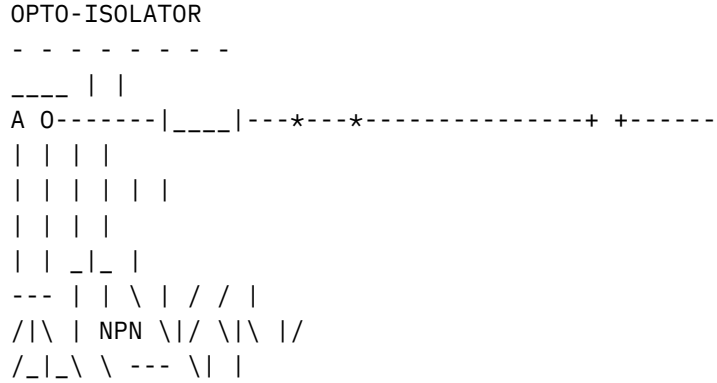
i) $CXFSI,,021875,t,*3A<CR><LF>
Scanning receiver set 2 187.5 kHz, mode F1B/J2B receive
only, teleprinter/DSC.

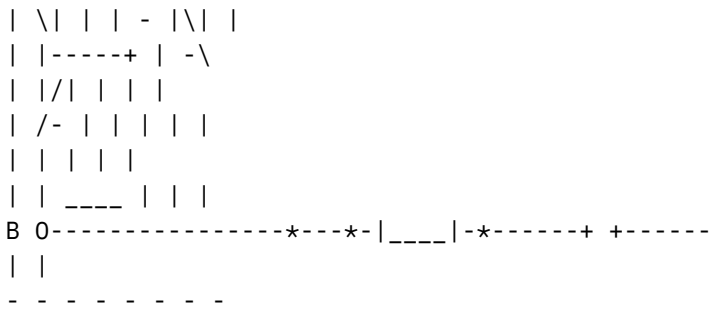
Page 41
7.2 Receiver Diagrams

The illustrative diagrams in Figure 3 and Figure 4 show the structure of two optoisolator based LISTENER circuits that offer overvoltage, reverse voltage and power dissipation protection for the optoisolator and serve- limit the current drawn from the line.



(Figure 3)





(Figure 4)

Januar 1, 1992

Sentences Not Recommended for New Designs

The following identifiers and senteces are scheduled to be phased out of use and are no longer recommended for sole use in new or revised designs. The senteces are valid sentences, but due to changing circumstances it is desirable to delete or replace these sentences as indicated below.

Generally in each of the sentence descriptions below reference is made to a sentence in the current Version of the standard, manufacturers are urged to use the currently recommended sentence in new or revised designs. It is desirable that manufacturers provide both new and old sentences whenever possible for a period of time that will serve as a phase-in period for the new sentences.

APA - Autopilot Sentence "A"

Commonly used by autopilots this sentence contains navigation receiver warning flag status, cross-track-error, waypoint arriv-al status and initial bearing from origin waypoint to the desti-nation waypoint for the active navigation leg of journy.

Use of $--APB with additional data fields of heading-to-steer and bearing from present position to destination is recommended.

```
$--APA,A,A,x.x,a,N,A,A,x.x,M,c--c*hh<CR><LF>
| | | | | | | | | |
| | | | | | | | | +---Destination waypoint ID
| | | | | | | | +-----\Magnetic
| | | | | | | +--------/Bearing origin to destination
| | | | | | +------------Status: perpendicular passed at waypoint
| | | | | +--------------Status: arrival circle entered
| | | | +---------------\XTE units, Nautical miles
| | | +-----------------|Direction to steer, L/R
| | +--------------------/Magnitude of XTE (cross-track-error)
| +-----------------------Data status: Loran-C Cycle Lock warning flag
+-------------------------Data status: "OR" of Loran-C Blink and SNR warning flags
```

BER - Bearing & Distance to Waypoint, Dead Reckoning, Rhumb Line
BPI - Bearing & Distance to Point of Interest

Time (UTC) and distance & bearing to, and locationof, a speci-fied waypoint from present position:

BER: Calculated along the rhumb line from dead reckoned
present position. The use of $--BEC using great circle
calculations is recommended.

BPI: Calculated along a great circle path from measured
present position. Redundant with BWC, the use of
$--BWC is recommended.

```
$--BER,hhmmss.ss,llll.ll,a,...
$--BPI,... | | |
| | +-------\N/S North or South
| +--------------/Waypoint latitude
+----------------------UTC of observation
```

```
yyyyy.yy,a,x.x,T,x.x,M,x.x,N,...
| | | | | | | |
| | | | | | | +--\nautical miles
| | | | | | +-----/Distance
| | | | | +--------\degrees Magnetic
| | | | +-----------/Bearing
| | | +--------------\degrees True
| | +-----------------/Bearing
| +--------------------\E/W East or West
+---------------------------/Waypoint longitude
```

```
c--c*hh<CR><LF>
|
+-----------------------------Waypoint ID
```

DBK - Depth Below Keel
DBS - Depth Below Surface

Water depth referenced to the vessel's keel (DBK) or to the
water surface (DBS).

The use of $--DPT is recommended in place of either of these.

```
$--DBK,x.x,f,x.x,M,x.x,F*hh<CR><LF>
$--DBS,x.x,f,x.x,M,x.x,F*hh<CR><LF>
| | | | | |
| | | | | +---------\Fathoms
| | | | +------------/Water depth
| | | +---------------\Meters
| | +------------------/Water depth
| +----------------------\feet
+------------------------/Water depth
```

Page I-03
DRU - DUAL DOPPLER AUXILIARY DATA

Depth, turn rate and % RPM in support of Doppler velocity sys-
tems.

The use of $--DPT is recommended for depth data, $--RPM for
shaft rotation and $--ROT for rate of turn.

```
$--DRU,x.x,A,x.x,A,x.x*hh<CR><LF>
| | | | |
| | | | +-------------Propeller shaft rotation, % of maximum
| | | +---------------\Status: Rate of turn
| | +-----------------/Rate of turn, degrees per minute, "-" = port
| +---------------------\Status: Depth
+------------------------/Depth

GDa - Dead Reckoning Positions
GLa - Loran-C Positions
GOa - OMEGA Positions
GXa - TRANSIT Positions

Location and time at waypoint "c--c":
$--aaF: predicted or estimated time
$--aaP: present position and time
$--aaA: past position and time

The use of waypoint location $--WPL (for past positions) or
$--GLL (for present position) followed by time tag $--ZDA is
recommended for reporting past or present waypoint times; $--WPL
followed by $--ZTG is recommended for estimated time.

Dead reckoned positions:
$--GDF,hhmmss.ss,llll.ll,a,...
$--GDP,...| | |
$--GDA,...| | +--------\N/S North or South
| +--------------/Latitude
+------------------------UTC of position fix

```

Page I-04
GTD - Geographical Position, Loran-C TDs

Loran-C Time Difference (TD) lines of position for present vessel position.

The use of $--GLC is recommended.

```
$--GTD,x.x,x.x,x.x,x.x,x.x*hh<CR><LF>
| | | | |
| | | | +---------TD 5, micro-seconds
| | | +-------------TD 4, micro-seconds
| | +-----------------TD 3, micro-seconds
| +---------------------TD 2, micro-seconds
+-------------------------TD 1, micro-seconds
```

HCC - Compass Heading

Vessel compass heading, which differs from magnetic heading by the amount of uncorrected magnetic variation.

The use of $--HDG is recommended.

```
$--HCC,x.x*hh<CR><LF>
|
+-------------------------Compass heading, degrees
```

HCD - Heading and Deviation

Actual Vessel magnetic heading, indicated compass heading and the difference (deviation) between them.

The use of $--HDG is recommended.

```
$--HCD,x.x,M,x.x,H,x.x,a*hh<CR><LF>
| | | | | |
| | | | | +---------\degrees E/W [1]
| | | | +------------/Magnetic deviation
| | | +---------------\Compass, degrees
| | +------------------/Heading
| +---------------------\Magnetic, degrees
+------------------------/Heading
```

Note:

[1] Easterly deviation (E) subtracts from Compass Heading
Westerly deviation (W) adds to Compass Heading

HDM - Heading, Magnetic

Actual vessel heading in degrees Magnetic.

The use of $--HDG is recommended.

```
$--HDM,x.x,M*hh<CR><LF>
| |
| +--------------------\degrees Magnetic
+----------------------/Heading
```

Page I-05
HVD - Magnet Variation, Automatic
HVM - Magnet Variation, Manually Set

Magnetic Variation, automatically derived (calculated or taken from a data base) (HDV), or manually entered (HVM).

The use of $--HDG is recommended.

```
$--HVD,x.x,a*hh<CR><LF>
$--HVM,x.x,a*hh<CR><LF>
| |
| +--------------------\degrees E/W [1]
+----------------------/Magnetic variation
```

Note:

[1] Easterly variation (E) subtracts from True Heading
Westerly variation (W) adds to True Heading

IMA - Vessel Identification

Limited utility, no recommended replacement.

```
$--IMA,aaaaaaaaaaaa,aaaxxxx,...
| |
| +----------Radio call sign
+---------------------12 character vessel name

llll.ll,a,yyyyy.yy,a,x.x,T,...
| | | | | |
| | | | | +----\degrees True
| | | | +-------/Heading
| | | +----------\E/W East or West
| | +-----------------/Longitude
| +---------------------\N/S North or South
+--------------------------/Latitude

x.x,M,x.x,N*hh<CR><LF>
| | | |
| | | +------------------\knots
| | +----------------------/Speed
| +-------------------------\degrees Magnetic
+---------------------------/Heading
```

MDA - Meteorological Composite

Barometric pressure, air and water temperature, humidity, dew
point and wind speed and direction relative to the surface of the
earth.

The use of $--MTW, $--MWV and $--XDR is recommended.

```
$--MDA,x.x,I,x.x,B,x.x,C,x.x,C,...
| | | | | | | |
| | | | | | | +---\degrees C
| | | | | | +------/Water temperature
| | | | | +---------\degrees C
| | | | +------------/Air temperature
| | | +---------------\bars
| | +------------------/Barometric pressure
| +--------------------\inches of mercury
+------------------------/Barometric pressure
```

```
x.x,x.x,x.x,C,x.x,T,x.x,M,...
| | | | | | | |
| | | | | | | +-----\degrees Magnetic
| | | | | | +--------/Wind direction
| | | | | +-----------\degrees True
| | | | +--------------/Wind direction
| | | +-----------------\degrees C
| | +--------------------/Dew point
| +-------------------------Absolute humidity, percent
+----------------------------Relative humidity, percent
```

```
x.x,N,x.x,M*hh<CR><LF>
| | | |
| | | +-------------------\meters/second
| | +----------------------/Wind speed
| +-------------------------\knots
+---------------------------/Wind speed
```

Page I-06
MHU - Humidity

The use of $--XDR is recommended.

```
$--MHU,x.x,x.x,x.x,C*hh<CR><LF>
| | | |
| | | +-------------\degrees C
| | +---------------/Dew point
| +--------------------Absolute humidity, percent
+------------------------Relative humidity, percent
```

MMB - Barometer

The use of $--XDR is recommended.

```
$--MMB,x.x,I,x.x,B*hh<CR><LF>
| | | |
| | | +---------------\bars
```

```
| | +------------------/Barometric pressure
| +--------------------\inches of mercury
+-----------------------/Barometric pressure
```

MTA - Air Temperature
MTW - Water Temperature

The use of $--XDR is recommended.

```
$--MTA,x.x,C*hh<CR><LF>
$--MTW,x.x,C*hh<CR><LF>
| |
| +-----------\degrees C
+--------------/Temperature
```

MWD - Wind Direction and Velocity, Surface

The use of $--MWV is recommended.

```
$--MWD,x.x,T,x.x,M,x.x,N,x.x,M*hh<CR><LF>
| | | | | | | |
| | | | | | | +---\meters/second
| | | | | | +------/Wind speed
| | | | | +---------\knots
| | | | +------------/Wind speed
| | | +---------------\degrees Magnetic
| | +------------------/Wind direction
| +---------------------\degrees True
+-----------------------/Wind direction
```

MWH - Wave Height

Limited utility, no recommended replacement.

```
$--MWH,x.x,f,x.x,M*hh<CR><LF>
| | | |
| | | +---------------\meters
| | +------------------/Wave height
| +---------------------\feet
+-----------------------/Wave height
```

MWS - Wind & Sea State

Limited utility, no recommended replacement.

```
$--MWS,xx,xx*hh<CR><LF>
| |
| +-----------------------Beaufort Sea State Code
+-------------------------Beaufort Wind Force Code
```

OLW - Omega Lane Width

Limited utility, no recommended replacement.

```
$--OLW,x.x,N,xxxx,M*hh<CR><LF>
| | | |
| | | +--------------\meters
| | +------------------/Lane width
| +---------------------\nautical miles
+-----------------------/Lane width
```

Page I-07
OMP - OMEGA Pairs

Limited utility, no recommended replacement.

```
$--OMP,1,aa,2,aa,3,aa*hh<CR><LF>
| | | | | |
| | | | | +-------------\AB-GH
| | | | +---------------/Pair 3
| | | +------------------\AB-GH
| | +--------------------/Pair 2
| +----------------------\AB-GH
+------------------------/Pair 1,
```

ONZ - Omega Zone Number

Limited utility, no recommended replacement.

```
$--ONZ,a*hh<CR><LF>
|
+--------------------------Station identifier, A-H
```

Rnn - Routes

Waypoint identifiers, listed in order with starting waypoint first
for route number "nn".

```
$--Rnn,c--c,c--c----,c--c*hh<CR><LF>
| | |
| | ... +-----------\
| +-----------------------/14 field sequence of route waypoint IDs
+-----------------------------nn = Route number
```

SBK - Loran-C Blink Status
SCY - Loran-C Cycle Lock Status

Loran-C warning flags for Blink (SBK) and Cycle Lock (SCY)
indicating that one or more Loran-C stations being used to
produce Lat/Lon and other navigation data are unreliable.

The use of $--GLC is recommended.

```
$--SBK,A*hh<CR><LF>
$--SCY,A*hh<CR><LF>
|
+--------------------------Warning Flag
```

SCD - Loran-C ECDs

The use of $--LCD is recommeded.

```
$--SCD,0,xxx,1,xxx,2,xxx,3,xxx,...
| | | | | | | |
| | | | | | | +----\
| | | | | | +-------/Secondary 3
| | | | | +----------\ECD
| | | | +-------------/Secondary 2
| | | +----------------\ECD
| | +-------------------/Secondary 1
| +----------------------\ECD
+------------------------/Master signal

4,xxx,5,xxx*hh<CR><LF>
| | | |
| | | +--------------------\ECD
| | +----------------------/Secondary 5
| +-------------------------\ECD
+---------------------------/Secondary 4
```

SDB - Loran-C Signal Strength

Limited utility, no recommended replacement.

```
$--SDB,x.x*hh<CR><LF>
|
+------------------------Signal strength, dB
```

SGD - Position Accuracy Estimate

Estimate of position accuracy based on geometric of precision (GDOP) and system noise, in feet and nauticl miles.

Limited utility, no recommended replacement.

```
$--SGD,x.x,N,x.x,f*hh<CR><LF>
| | | |
| | | +---------------\feet
| | +------------------/Accuracy
| +--------------------\nautical miles
+-----------------------/Accuracy
```

SGR - Loran-C Chain Identifier

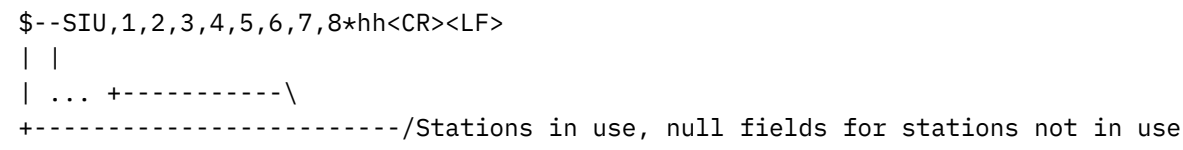
The unique Loran-C Chain identifier, representing Group Repetition Interval (GRI) in tens of microseconds (Group Repetition Interval = [Chain ID]*10, microseconds).

The use of $--GLC is recommended.

```
$--SGR,xxxx*hh<CR><LF>
|
+------------------------GRI, tens of microseconds
```

SIU - Loran-C Stations in Use

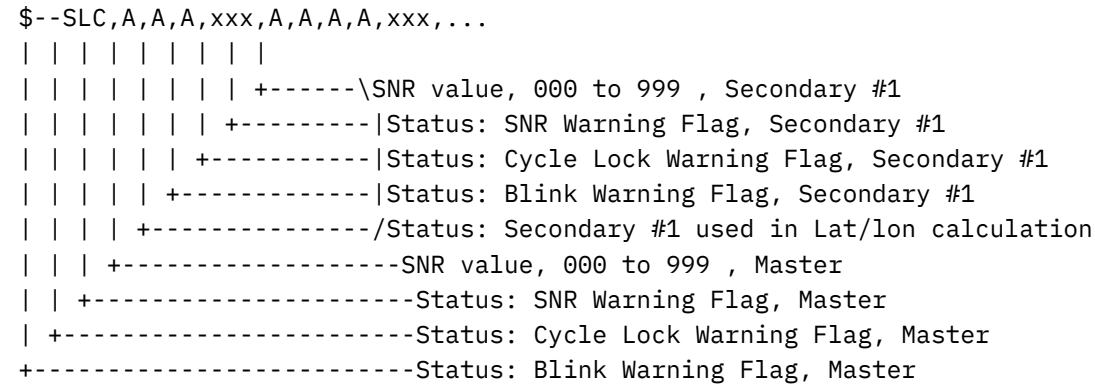
The use of $--GLC is recommended.



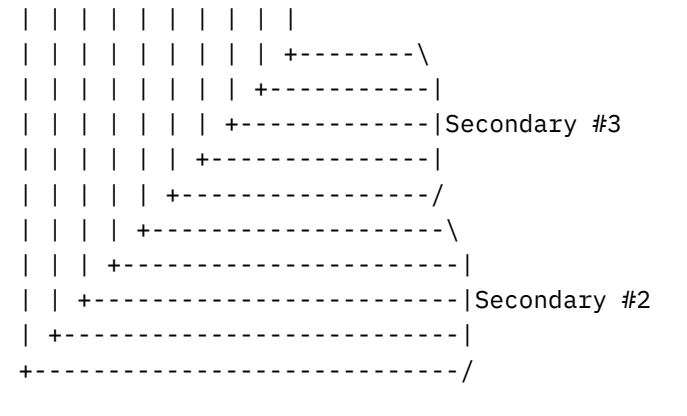
SLC - Loran-C Status

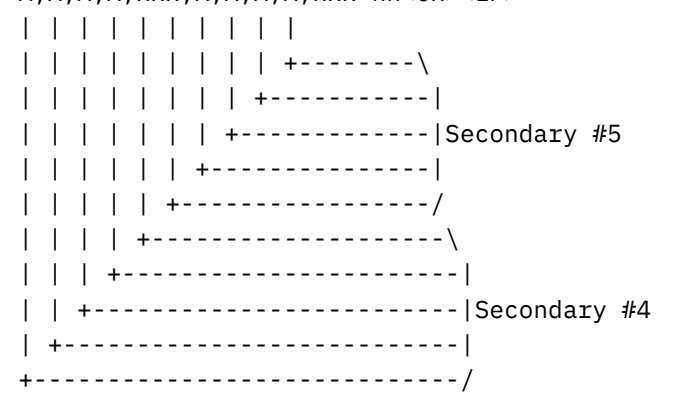
Blink, Cycle and SNR warning status and SNR value for all
stations. Stations used in Lat/Lon conversion are identified.

The use of $--GLC and/or $--LCD is recommended.



$--SLC,A,A,A,xxx,A,A,A,A,xxx,...
+------\SNR value, 000 to 999 , Secondary #1
+---------|Status: SNR Warning Flag, Secondary #1
+-----------|Status: Cycle Lock Warning Flag, Secondary #1
+-------------|Status: Blink Warning Flag, Secondary #1
+---------------/Status: Secondary #1 used in Lat/lon calculation
+-------------------SNR value, 000 to 999 , Master
+----------------------Status: SNR Warning Flag, Master
+------------------------Status: Cycle Lock Warning Flag, Master
+--------------------------Status: Blink Warning Flag, Master





SNC - Navigation Calculation Basis

Basis for navigation calculations, Great Circle or Rhumb Line.

Limited utility, no recommended replacement.

```
$--SNC,a*hh<CR><LF>
|
+-------------------------Great Circle or Rhumb Line, G/R
```

Page I-09

SNU - Loran-C SNR Status

Loran-C warning flag for Signal-To-Noise-Ratio indicating that one or more Loran-C stations being used to produce Lat/Lon and other navigation data are unreliable.

The use of $--GLC is recommended.

```
$--SNU,A*hh<CR><LF>
|
+-------------------------Warning Flag
```

SPS - Loran-C Predicted Signal Strength

Limited utility, no recommended replacement.

```
$--SPS,xx*hh<CR><LF>
|
+-------------------------Signal strength, dB
```

SSF - Position Correction Offset

Amount of offset, and direction of offset, applied to measured position Lat/Lon to produce a displayed position Lat/Lon.

Limited utility, no recommended replacement.

```
$--SSF,x.x,a,x.x,a*hh<CR><LF>
| | | |
| | | +---------------\E/W East or West
| | +-----------------/Longitude offset, minutes
| +---------------------\N/S North or South
+-----------------------/Latitude offset, minutes
```

STC - Time Constant

Time constant specified manually for use in navigation calcula-tions.

Limited utility, no recommended replacement.

```
$--STC,xxx*hh<CR><LF>
|
+-------------------------Time constant, 000 to 999 seconds
```

STR - Tracking Reference

Transmitted prior to a sentence containing velocity-based data
to indicate when velocity is measured over-the-ground or rela-
tive to the water.

The use of appropriate ground or water-referenced approved
sentences such as $--VBW, $--VHW or $--VTG is recommended.

```
$--STR,a*hh<CR><LF>
|
+-------------------------A = Ground reference, V = Water reference
```

SYS - Hybrid System Configuration

Limited utility, no recommended replacement.

```
$--SYS,L,O,T,G,D*hh<CR><LF>
| | | | |
| | | | +-----------------DECCA \
| | | +-------------------GPS \
| | +---------------------TRANSIT Null fields for systems not in use
| +-----------------------OMEGA /
+-------------------------LORAN-C /
```

TEC - TRANSIT Satellite Error & Doppler Count

The use of $--TRF is recommended.

```
$--TEC,A,A,A*hh<CR><LF>
| | |
| | +---------------------Status: Iteration number
| +-----------------------Status: Doppler count
+-------------------------Status: Maximum angle
```

TEP - TRANSIT Satellite Predicted Elevation

Limited utility, no recommended replacement.

```
$--TEP,x.x,D*hh<CR><LF>
| |
| +--------------------\degrees
+-----------------------/Elevation
```

TGA - TRANSIT Satellite Antenna & Geoidal Heigths

Limited utility, no recommended replacement.

```
$--TGA,x.x,M,x.x,M,x.x,M*hh<CR><LF>
| | | | | |
| | | | | +---------\meters
| | | | +------------/Antenna + geoidal height
| | | +---------------\meters
| | +------------------/Geoidal height
| +--------------------\meters
+-----------------------/Antenna height
```

TIF - TRANSIT Satellite Initial Flag

Limited utility, no recommended replacement.

```
$--TIF,a*hh<CR><LF>
|
+-------------------------Normal operation = A
Set initialization data = V
Initialization data complete = J
```

TRP - TRANSIT Satellite Predicted Direction of Rise

Limited utility, no recommended replacement.

```
$--TRP,aa*hh<CR><LF>
|
+-------------------------Southeasterly = SE, southwesterly = SW
```

TRS - TRANSIT Satellite Operating Status

Limited utility, no recommended replacement.

```
$--TRS,a*hh<CR><LF>
|
+-------------------------Acquiring = A
Calculating = c
Error = e
Message = m
Test = T
Dead reckoning = U
```

VCD - Current at Selected Depth

Limited utility, no recommended replacement.

```
$--VCD,x.x,f,x.x,M,x.x,N,x.x,M*hh<CR><LF>
| | | | | | | |
| | | | | | | +---\meters/second
| | | | | | +------/Current
| | | | | +---------\knots
| | | | +------------/Current
| | | +---------------\meters
| | +------------------/Depth
| +---------------------\feet
+------------------------/Depth
```

VPE - Speed, Dead Reckoned Parallel to True Wind

Limited utility, no recommended replacement.

```
$--VPE,x.x,N,x.x,M*hh<CR><LF>
| | | |
| | | +---------------\meters/second
| | +------------------/Speed, "-" = downwind
| +---------------------\knots
```

```
+------------------------/Speed, "-" = downwind
```

VTA - Actual Track

Limited utility, possible use of $--VTG for a portion of the data.

```
$--VTA,x.x,T,x.x,M,x.x,N,x.x,N*hh<CR><LF>
| | | | | | | |
| | | | | | | +---\nautical miles
| | | | | | +------/Distance made good
| | | | | +---------\knots
| | | | +------------/Speed made good
| | | +---------------\degrees Magnetic
| | +------------------/Track made good
| +---------------------\degrees True
+------------------------/Track made good
```

VTI - Intended Track

Limited utility, no recommended replacement.

```
$--VTI,x.x,T,x.x,M,x.x,N,x.x,N*hh<CR><LF>
| | | | | | | |
| | | | | | | +---\nautical miles
| | | | | | +------/Distance made good
| | | | | +---------\knots
| | | | +------------/Speed made good
| | | +---------------\degrees Magnetic
| | +------------------/Intended Track
| +---------------------\degrees True
+------------------------/Intended Track
```

VWE - Wind Track Efficiency

Limited utility, no recommended replacement.

```
$--VWE,x.x*hh<CR><LF>
|
+-------------------------Efficiency, percent
```

VWR - Relative (Apparent) Wind Speed and Angle

Wind angle in relation to the vessel's heading and wind speed measured relative to the moving vessel.

The use of $--MWV is recommended.

```
$--VWR,x.x,a,x.x,N,x.x,M,x.x,K*hh<CR><LF>
| | | | | | | |
| | | | | | | +---\Km/Hr
| | | | | | +------/Wind speed
| | | | | +---------\meters/second
| | | | +------------/Wind speed
| | | +---------------\knots
```

```
| | +------------------/Measured wind Speed
| +--------------------\L/R Left or Right of vessel heading
+-----------------------/Measured wind angle relative to the vessel, 0 to 180 deg
```

VWT - True Wind Speed and Angle

True wind angle in relation to the vessel's heading and true wind speed referenced to the water. True wind is the vector sum of the Relative (Apparent) wind vector and the vessel's velocity vector relative to the water along the heading line of the vessel. It represents the wind at the vessel if it were stationary relative to the water and heading in the same direction.

The use of $--MWV is recommended.

```
$--VWT,x.x,a,x.x,N,x.x,M,x.x,K*hh<CR><LF>
| | | | | | | |
| | | | | | | +---\Km/Hr
| | | | | | +------/Wind speed
| | | | | +---------\meters/second
| | | | +------------/Wind speed
| | | +---------------\knots
| | +------------------/Calculated wind Speed
| +--------------------\L/R Left or Right of vessel heading
+-----------------------/Calculated wind angle relative to the vessel, 0 to 180 deg
```

WDC - Distance & Waypoint

Distance from present position to the specified waypoint.

The use of $--BWC is recommended.

```
$--WDC,x.x,N,c--c*hh<CR><LF>
| | |
| | +------------------Waypoint identifier
| +--------------------\nautical miles
+-----------------------/Distance
```

WDR - Waypoint Distance, Rhumb Line

The use of $--WDC using great circle calculations is recommend-
ed.

```
$--WDR,x.x,N,c--c*hh<CR><LF>
| | |
| | +------------------Waypoint identifier
| +--------------------\nautical miles
+-----------------------/Distance
```

WFM - Route Following Mode

Limited utility, no recommended replacement.

```
$--WFM,a*hh<CR><LF>
|
+-------------------------Mode: "A" = automatic, "V" = manual
```

WNR - Waypoint-to-Waypoint Distance, Rhumb Line

The use of $--WNC using great circle calculations is recommend-
ed.

```
$--WNR,x.x,N,x.x,K,c--c,c--c*hh<CR><LF>
| | | | | |
| | | | | +--------
| | | | +-------------
| | | +---------------\
| | +------------------/
| +----------------------\
+------------------------/
```

YWP - Water Propagation Speed

Limited utility, no recommended replacement.

```
$--YWP,x.x,f,x.x,M*hh<CR><LF>
| | | |
| | | +---------------\meters/second
| | +------------------/Speed
| +----------------------\feet/second
+------------------------/Speed
```

YWS - Water Profile

Limited utility, no recommended replacement.

```
$--YWS,x.x,x.x,x.x,C,x.x,f,x.x,M*hh<CR><LF>
| | | | | | | |
| | | | | | | +-\meters
| | | | | | +----/Depth
| | | | | +-------\feet
| | | | +----------/Depth
| | | +-------------\degrees C
| | +----------------/Temperature at depth
| +----------------------Chlorinity, parts/thousand
+-------------------------Salinity, parts/thousand
```

Zaa - Time, Elapsed/Estimated

Elapsed time from point-of-interest.
The use of $--ZFO is recommended.

```
$--ZFI,hhmmss.ss,hhmmss.ss,c--c*hh<CR><LF>
| | |
| | +-----Waypoint ID
| +--------------Elapsed time from waypoint
+------------------------UTC
```

```
Arrival time at point-of-interest.
The use of $--ZTG is recommended.

$--ZPI,hhmmss.ss,hhmmss.ss,c--c*hh<CR><LF>
| | |
| | +-----Waypoint ID
| +--------------Arrival time at waypoint
+------------------------UTC

Estimated time of arrival at waypoint.
The use of $--ZTG is recommended.

$--ZTA,hhmmss.ss,hhmmss.ss,c--c*hh<CR><LF>
| | |
| | +-----Waypoint ID
| +--------------Estimated time at waypoint
+------------------------UTC

Estimated time to event/point-of-interest.
The use of $--ZTG is recommended.

$--ZTE,hhmmss.ss,hhmmss.ss,c--c*hh<CR><LF>
$--ZTI,hhmmss.ss,hhmmss.ss,c--c*hh<CR><LF>
| | |
| | +-----Waypoint ID
| +--------------Estimated time-to-go to waypoint
+------------------------UTC

Arrival time at waypoint.
The use of $--ZTG is recommended.

$--ZWP,hhmmss.ss,hhmmss.ss,c--c*hh<CR><LF>
| | |
| | +-----Waypoint ID
| +--------------Arrival time at waypoint
+------------------------UTC

Page I-14
ZCD - Timer

Limited utility, no recommended replacement.

$--ZCD,xxxxxx,a*hh<CR><LF>
| |
| +-------------------Control: "+" = count up
| "-" = count down
| "V" = stop count
+------------------------Timer initial value, seconds

ZEV - Event Timer

Limited utility, no recommended replacement.

$--ZEV,hhmmss.ss,hhmmss.ss,a,c--c*hh<CR><LF>
| | | |
```

```
| | | +---Waypoint ID
| | +------Control: "+" = count up
| | "-" = count down
| | "V" = stop count
| +--------------Timer initial value, seconds
+------------------------UTC
```

ZLZ - Time of Day

Time of day in hours-minutes-seconds, both with respect to (UTC) and the local time zone.

The use of $--ZDA is recommended.

```
$--ZEV,hhmmss.ss,hhmmss.ss,xx*hh<CR><LF>
| | |
| | +------Local zone description [1], -12 to +12
| +--------------Local time
+------------------------UTC
```

Notes:

[1] Zone description is the number of whole hours added to local time to obtain GMT, Zone description is negative for East longitudes.

ZZU - Time, UTC

The use of $--ZDA is recommended.

```
$--ZZU,hhmmss.ss*hh<CR><LF>
|
+------------------------UTC
```

NMEA 0183 APPENDIX IV

Version 2.00

January 1, 1992

GLOSSARY

accuracy - in navigation, a measure of the error between the point desired and the point achieved, or between the position indicated by measurement and the true position [compare with precision].

address field - for sentences in this standard, the fixed length field following the beginning sentence delimiter "$" (HEX 24). For approved sentences, composed of a two character talker identifier and a three character sentence formatter. For proprietary sentences, composed of the charcter "P" (HEX 50) followed by a three character manufacturer identification code.

additional secondary factor - in Loran-C, a correction in addition to the secondary phase factor correction for the additional time (or phase delay) for transmission of a low frequency signal over a composite land-seawater path when the signal transit time is based on the free-space velocity.

apparent wind - (see 'relative wind').

approved sentence - a sentence which has been approved for general use by the NMEA general assembly and is listed in this standard and attached Appendices.

arrival alarm - an alarm signal issued by a voyage tracking unit which indicates arrival at or at a pre-determined distance from a waypoint. - (see 'arrival circle')

arrival circle - an artificial boundary placed around the destination waypoint of the present navigation leg, the entering of which will signal an arrival alarm.

arrival perpendicular - crossing of the line which is perpendicular to the course line and which passes through the destination waypoint.

azimuth - the horizontal direction of a celestial point from a terrestrial point, expressed as the angular distance from a reference direction, usually measured from 000deg at the reference direction clockwise through 360deg.

ASCII - American Standard Code for Information Interchange. A 7 bit wide serial code describing numbers, upper and lower case alpha, characters, special and non-printing charcters. See American National Standards Institute documents ANSI X 3.15, ANSI X 3.16 and ANSI X 3.4.

atomic time - time obtained by counting the cycles of a signal in resonance with certain kinds of atoms.

autopilot - an automatic device for steering a vessel so as to maintain its heading in an intended direction. Mechanical means are used to steer the rudder. A radio navigation system is often connected to correct for track errors, or to select new destinations.

bearing - the horizontal direction of one terrestrial point from another, expressed as the angular distance from a reference direction, usually measured from 000deg at the reference direction clockwise through 360deg.

Beaufort wind scale - a numerical scale for indicating wind speed. Beaufort numbers (or forces) range from force 0 (calm) to force 12 (hurricane).

blink - in Loran-C, a signal used to indicate that a station is malfunctioning. Intended to prevent use of that signal for navigation.

checksum - for this standard, a validity check performed on the data contained in the sentence, calculated by the talker, appended to the message, when recalculated by the listener for comparison to determine if the message was received correctly. Required for some sentences, optional for all others.

communication protocoll - a method established for message transfer between a talker and a listener which includes the message format and the sequence in which the message are to be transferred. Also includes the signaling requirements such as baud rate, stop bits, parity, and bits per character.

course - the horizontal direction in which a vessel is steered or intended to be steered, expressed as angular distance from north, usually from 000deg at north, clockwise through 360deg. Strictly, the term applies to direction through the water, not the direction intended to be made good over the ground (see 'track'). Differs from heading.

course over ground (COG) - term used to refer to the direction of the path over ground actually followed by a vessel [a misnomer in that courses are directions steered or intended to be steered through the water with respect to a reference meridian].

cross track error (XTE) - the distance from the vessel's present position to the closest point on a line between the origin and destination waypoints of the navigation leg being travelled.

Page IV-2
cycle lock - in Loran-C, the comparison, in time difference, between corresponding carrier cycles contained in the rise times of a master and slave station pulse is called cycle match. This value when refined to a determination of the phase difference between these two cycles results in cycle lock. (See also 'envelope-to-cycle distortion').

data field - in an NMEA 0183 sentence, a field which contains a data value.

dead reckoning - the process of determining the position of a vessel at any instant by applying to the last well-determined position (point of departure or subsequent fix) the run that has since been made, usually based on the recent history of speed and heading measurements.

Decca chain - a group of associated stations of the Decca Navigator System. A Decca chain normally consists of a master and three slave stations. Each slave station is called by the color of associated pattern of hyperbolic lines as printed on the chart, i.e., red slave, green slave, purple slave.

Decca Navigator System - a short to medium range low frequency (70-130 kHz) radionavigation system by which a hyperbolic line of position of high accuracy is obtained. The system is an arrangement of fixed, phase locked, continuous wave transmitters operating on harmonically related frequencies and special receiving equipment located on a vessel.

delimiter - in this standard, a character or characters used to separate fields or sentences. The following delimiters are used in this standard:

field delimiters - ASCII "$" (HEX 24) for address fields
- ASCII "," (HEX 2C) for data fields
- ASCII "*" (HEX 2A) for checksum field

sentence delimiters - carriage return <CR> and line feed <LF> (HEX 0D0A)
[note: a <CR><LF> is not required preceding the first sentence transmitted]

depth sounder - an instrument which determines the depth of water by measuring the time interval between the emissions of a sound and the return of its echo from the bottom.

destination - the immediate geographic point of interest to which a vessel is navigating. It may be the next waypoint along a route of waypoints or the final destination of a voyage.

deviation - the angle between the magnetic meridian and the axis of a compass card, expressed in degrees east or west to indicate direction in which the northern end of the compass card is offset from magnetic north.

Page IV-3
Doppler speed log - an instrument which measures the relative motion between a vessel and the reflective sea bottom (for bottom return mode) or suspended particulate matter in the seawater itself (for water return mode) by measuring the frequency shifts between a transmitted and subsequently echoed acoustic or electromagnetic signal.

drift - the speed of a current.

echo sounder - (see 'depth sounder').

envelope-to-cycle distortion (ECD) - the time relationship between the phase of the Loran-C carrier and the time origin of the envelope waveform.

field - in this standard, a character or string of characters immediately preceded by a field delimiter (see 'delimiters').

fixed field - in this standard, a field in which the number of characters is fixed. For data fields, such fields are shown in the sentence definitions with no decimal point. Other fields which fall into this category are the address field and the checksum field (if present).

geoid - a surface along whith the gravity potential is everywhere equal (equipotential surface) and to which the direction of gravity is always perpendicular.

geometric dilution of precision (GDOP) - a value representing all geometric factors that degrade the accuracy of a position fix which has been derived from a navigation system.

Global Positioning System (GPS) - (full name NAVSTAR Global Positioning System) an all-weather, continuous satellite navigation system being developed by the Department of Defense under Air Force management. The fully deployed operational system is intended to provide highly accurate position and velocity information in three dimensions and precise time and time interval on a global basis, to an unlimited number of authorized users. Although developed primarily for military missions, current policy calls for civil availability with a degradation in system accuracy in order to protect U.S. national security interests.

great circle - the intersection of the surface of a sphere and a plane through its center.

great circle chart - a chart on which a great circle appears as a straight line or approximately so.

great circle direction - horizontal direction of a great circle, expressed as angular distance from a reference direction.

group repetition interval (GRI) - of a particular Loran-C chain, the specified time interval for all stations of the chain to transmit their pulse groups. For each chain a minimum group

repetition interval is selected of sufficient duration to provide time for each station to transmit its pulse group and additional time between each pulse group so that signals from two or more stations cannot overlap in time anywhere within the coverage area.

gyrocompass - a compass having one or more gyroscopes as the directive element, and which is north-seeking. Its operation depends upon four natural phenomena: gyroscopic inertia, gyroscopic precession, the earth's rotation, and gravity.

gyropilot - an automatic device for steering a vessel by means of control signals received from gyrocompass (see 'autopilot').

gyroscope - a rapidly rotating mass free to move about one or both axes perpendicular to the axis of rotation and to each other.

heading - the horizontal direction in which a ship actually points or heads at any instant, expressed in angular units from a reference direction, usually from 000deg at the reference direction clockwise through 360deg. (See 'true heading' and 'magnetic heading')

heading-to-steer - the difference between the bearing to destination (from present position) and track-made-good, applied to the bearing to the destination to produce a heading that will guide the vessel to the destination.

horizontal dilution of precision (HDOP) - similar to GDOP, except elevation factors are ignored.

keel - a longitudinal timber or plate extending along the center of the bottom of a ship and often projecting from the bottom.

line of position (LOP) - in Loran or Decca navigation systems, a vector obtained by measurement of the time difference between the receipt of the master and slave signals which is then used to selected a corresponding LOP from a chart or table, Two or more intersecting LOP's are required to obtain a position fix.

listener - in this standard, the recipient of message across the interconnecting link.

log - an instrument for measuring the speed or distance or both traveled by a vessel.

Loran - the general designation of one group of radionavigation systems by which a hyperbolic line of position is determined through measuring the difference in the times of reception of synchronized pulse signals from two fixed transmitters.

magnetic bearing - bearing relative to magnetic north; compass bearing corrected for deviation.

magnetic heading - heading relative to magnetic north.

manufacturer identification code - in this standard, a three character manufacturer identifier, usually an acronym derived from the company name, which has been approved and is listed in Appendix III, for use by a manufacturer as part of the address field in formulation of proprietary sentences.

Mercator map projection - a conformal cylindrical map projection in which the surface of a sphere or spheroid, such as earth, is conceived as developed on a cylinder tangent along the equator. Meridias appear as equally spaced vertical lines and parallels as horizontal lines drawn farther apart as the latitude and longitude scales at any point is maintained. Also known as Mercator map projection.

Navigation Leg - the portion of a voyage upon which the vessel currently travels. Each leg consists of two waypoints, an ORIGIN, a DESTINATION, and a line between between them, upon which the vessel travels.

Navy Navigation Satellite System (TRANSIT) - an operational satellite navigation system of the united States conceived and developed by the Applied Physics Laboratory of John Hopkins University for the U.S. Navy. It is an all-weather, worldwide, and passive system used primarily for the navigation of surface ships and submarines. Also known by the acronyms NAVSAT or TRANSIT, it consists of a constellation of orbiting satellites, a ground system of tracking stations, and any number of user stations (navigators). The user stations are radionavigation devices composed of a receiver, a frequency cycle-counter, and a computer. The minimum constellation for system operation is four satellites (five satellites in orbit provide redundancy). The satellite orbits are controlled by the tracking stations. Satellites broadcast current known positions while orbiting the earth. The NAVSAT system utilizes the Doppler shift of radio signals transmitted from the satellite to measure the relative velocity between the satellite and the navigator. Knowing the satellite orbit precisely, the navigator's absolute position can be accurately determined from this time rate of change of range to the satellite.

null field - in this standard, indicates that data is not available for the field. Indicated by two ASCII commas, i.e., ",,"

(HEX 2C2C), or, for the last data field in a sentence, one comma followed by either the checksum delimiter "*" (HEX 2A) or the sentce delimiters <CR><LF> (HEX 0D0A). [Note: the ASCII Null character (HEX 00) is not to be used for null fields!]

Omega Navigation System - a worldwide, continuous, radionavigation system of medium accuracy which provides hyperbolic lines of position through phase comparisons of VLF (10-14kHz) continuous wave signals transmitted on a common frequency on a time-shared basis. The fully implemented system is comprised of only eight transmitting stations.

one-way communication protocol - a protocol established between a talker and a listener in which only the talker may send messages [compare to 'two-way communication protocol'].

origin waypoint - the starting point of the present navigation leg.

precision - a measure of how close the outcome of a series of observations or measurements cluster about some estimated value of a desired quantity, such as the average value of a series of observations of a quantity. Precision implies repeatability of the observations within some specified limit and depends upon the random errors encountered due to the quality of the observing equipment, the skill of the observer and randomly fluctuating conditions such as temperature, pressure, refraction, ect. [compare with 'accuracy'].

proprietary sentence - a sentence to be sent across the interconnecting link which is not included in the List of Approved Sentences of this standard. All proprietary sentences sent over the interconnecting link shall contain a unique talker identifier which bwgins with a "P" (HEX 50) followed by a three character manufacturer identification code.

relative bearing - bearing relative to heading or to vessel.

relative wind - the speed and relative direction from which the wind appears to blow with reference to a moving point (also called apparent wind).

rhumb line - a line on the surface of the earth making the same oblique angle with allmeridians. A rhumb line is a straight line on a rhumb (or Mercator) projection.

rhumb direction - the horizontal direction of a rhumb line, expressed as angular distance from a refernce direction. Also known as Mercator direction. (See Mercator map projection).

RMa sentence - Recommended Minimum Acceptable sentence, a composite sentence recommended by this standard to insure interopera-

bility between talkers and listeners and to insure that all data considered necessary for navigation is sent by a particular navigation unit.

route - a planned course of travel, usually composed of more than one navigation leg.

route system - any system of one or more routes and/or routing measures aimed at reducing the risk of casualties schemes, recommended tracks, restricted areas, inshore traffic zones, etc.

semi-fixed field - data fields having a base other than 10, but use base 10 to express precision of the final term (such as minutes expressed as units with a decimal trailer instead of sec-

onds in a base 60 field, or seconds expressed with a decimal trailer).

selected waypoint - the waypoint currently selected to be the point toward which the vessel is travelling. Also called "TO" Waypoint, destination or destination waypoint.

sentence formatter - in this standard, a three charcter sentence identifier which follows the talker identifier ans is included as part of the address field. The sentence formatters are an integral part of the sentence definitions provided by this standard and attached appendices.

set - the direction towards which a current flows.

speed log - an instrument for measuring a vessel's speed through water and/or speed over ground. Asingle axis speed log normally measures speed along the longitudinal (fore/aft) axis of the vessel, while a dual axis speed log measures speed along the transverse (port/starboeard) axis as well. (Also see 'Doppler speed log').

speed made good - the adjusted speed which takes into account factors such as drift and wind speed. Can be estimated or computed ny a navigation receiver.

speed over ground (SOG) - the speed of a vessel along the actual path of travel over the ground.

signal-to-noise ratio (SNR) - the ratio of the magnitude of a signal to that of the noise (interference), often expressed in decibels.

talker - in the NMEA 0183 Standard, the originator of messages across an NMEA 0183 link.

talker identifier - the first two characters following the "$" (HEX 24) in an NMEA 0183 sentence (address character 1 and 2);

selected from Table - Talker Identifier, Mnemonics of the NMEA 0183 Standard.

time difference (TD) - in Loran-C, the time difference measured from the time of reception of the master station signal to the time of reception of the slave station signal.

track - the intended or desired horizontal direction of travel with respect to the earth. The track expressed in degrees of the compass may differ from the course due to allowence made in the course for such factors as sea and weather conditions in order to resume the desired track (see 'track made good').

track made good - the single resultant direction from a point of departure to a point of arrival at any given time.

transducer - a device that converts one type of energy to another, as a loudspeaker that changes electrical energy into acoustical energy.

true bearing - bearing relative to true north; compass bearing corrected for compass error.

true heading - heading relative to true north.

to-way-communication protocol - a protocol established between a talker and a listener in which the listener may also issue requests to the talker when required [compare to 'one-way communication protocol].

UART - Universal Asynchronous Receiver/Transmitter which produces an electrical signal and timing for transmission of data over a communication path, and circuitry for detection and capture of such data transmitted from another UART.

Iniversal Time Coordinated (UTC) - a time scale based on the rotation of the earth which is disseminated by most broadcast time services [compare with 'atomic time'].

variable field - in NMEA 0183 sentences, a data field which may or may not contain a decimal point depending on the requirements and the accuracy of the measuring device (talker).

variation - the angle between the magnetic and geographic meridians at any place, expressed in degrees and minutes east or west to indicate the direction of magnetic north from true north.

waypoint - a reference point on a track.

From: robboma@aol.com
Message-ID: <3ctq3e$1tb@newsbf01.news.aol.com>
Source record: 45879

Can anyone explain how the G3RUH modem recovers the received clock?

As I recall (I don't have the schematic in front of me) it detects the transistions of the RX data and applies them to a pair of up/down counters. These fed a ROM that is also fed by a TX clock source. The output of the ROM is converted to an analog signal and is the received clock signal. Can someone who is more familiar with this fill in the blanks (or make corrections!)? Just what is stored in the ROM and what does the signal coming out look like? Is this method very good with noisey signals?

Any insight would be appreciated.

Bob Masucci, WB3DBL.

-> I'm also using the Timewave 59+. Very useful for HF work, both
-> packet and voice. Also have used it for SAREX to pull out just that
-> little bit more
Hi Bob.
I have DSP Timewave 59+.
It works fine with me on SSB also on HF Packet.
My problem.
I am using F6FBB for packet .
When i start forwarding with another F6FBB station at the middle of
message it link out .It cut the link and a message come saying
some thing like cannot forward binary files or says cannot transfer only
binary files..
I stopped using it when i face this problem so i did not remember the
text exactly..!!
Have u faced this problem...??
Also i noticed that PCL is longer than when i am forwarding without
DSP.
The only good thing i found it can shows me my BEACON and any data i
transmit.]
Any help from u is Appriciated.

I was looking at few configuration files that came in the JDOC.ZIP file
that I got with JNOS, I saw that N8FOW was using something called
TNCSLIP, witch used an ordinary KISS TNC to run SLIP over.

he used this command: attach asy 0x2f8 0x3 tncslip.....

Is this an approved addition of JNOS, and where can I get the source??

+ Has somone written a source to implement YAPP protocole for data
transfer over AX.25 for JNOS + Is there a Compressed forwarding
routines available to forward with F6FBB BBS.

ps email or post.

The smallest terminals I have found are the HP palmtops (HP95LX, HP100LX, HP200LX). They can fit into a coat pocket. They are 1/4 or 1/2 of a CGA screen and run DOS 3.2 in ROM plus other "personnel assistant" applications in ROM.

With an HP95LX, Kantronics KPC9612 and an HT, I have "backpack packet".

The VHF packet operation of the PK-232 is unaffected by the mod as Bob
indicated. The HF operation is supposed to be adversely affected by the mod,
but my tests did not show any significant problem with decoding HF packet
after the mod (i'm sure the performance was at least somewhat degraded,
as the mod does affect filter shape).

I've changed over to the KAM Plus, and prefer this to the PK-232. For
HF contesting, the modified PK-232 and the unmodified KAM Plus seem to
work equivalently.

4797. Optimal settings for packet on VHF & HF

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-17 23:08:19 UTC
From: cjvan@worf.infonet.net
Message-ID: <3cvr13$u7c@insosf1.infonet.net>
Source record: 45887

Hi,

Can anybody tell me what are the best settings to use for packet on 2
meters and HF? What are the recommended TNC settings for reducing frequency
clutter and collisions? I've got a KAM Enhanced here. Oh, and the
primary use of my station is really to be on 2 meter packet all the time
and recieve my mail forwarding, and somebody may occasionally use the
KA-node. I use HF packet mainly just to act as a gateway from 2 meters
for anybody who would like to use my station as a node/gateway.

Thanks.

73,
Chris

The correct callsign for the BBS is R0MIR-1. The digi (not on all the time) is R0MIR. Don't forget to set your TNC to MON all pkts. MON 6 on AEA TNC's. Also set MCON to 6. This way you can see if MIR is sending you packets. Good luck!

Adam, to operate what is known as "packet radio", on the airwaves you need to have an amateur radio license. A Technician license (no code requirement) is enough to operate packet on the VHF/UHF bands. You can get all the materials for studying for this license from your local ham radio dealer. Look in the classified. Or you can get them from the ARRL 225 Main Street in Newington CT. QST magazine is great for getting all you need to know. Packet radio uses the AX.25 protocol not unlike standard x.25 packet protocol. You will need several pieces of equipment: a transceiver that can operate on the VHF 2 meter band, a TNC (a modem and controller that deciphers AX.25 packets and delivers them to your computer via an RS232 port) and some computer software (tons available.) You can also operate TCP/IP over the AX.25 link and connect to the Internet via the various amateur radio gateways. People do all kinds of things on packet radio: you can connect to amateur radio BBS's that reside on amateur radio satellites orbiting the earth, send e-mail to other hams on the other side of the earth via forwarding BBS's on the ground and in the air, chat with hams computer to computer, download files etc. If you pass the 5 word per minute code test, then you can operate on certain portions of the HF bands (lower frequencies). With more study and more code speed you can operate RTTY, AMTOR and PACTOR (digital modes) and ragchew with hams all over the world keyboard to keyboard. You will love evry minute of it for the rest of your life. Don't listen to the complainers on the newsgroups about the code test etc. Take every test, study for every test element get your EXTRA class license and while they're complaining you will be making digital contacts on every band and having a ball! You'll also have fun using CW (Morse code). There are some propagation conditions that make CW mandatory like bouncing your signals off the moon and the aurora borealis. Meteor scatter is virtually impossible without CW. (Some even use packet radio with meteor scatter). There is no hobby more rewarding! Regards and enjoy! Joe KO4EI

4800. Newbie Packet & SSTV questions

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-18 01:21:45 UTC

Well, I'm expecting my license to arrive in mid-January. Meanwhile I'm looking at equipment. I think I'm going to get the Radio Shack HTX-202 and some type of external antenna.

My question is... What goes on in the world of packet radio? What will I be able to do if I get a TNC? I currently have a 386/40DX (soon to be 486DX2/80) and a 14400bps modem. I've enjoyed using local BBSs and Internet (obviously) for a couple of years now. Is packet radio similar? "BBSs" set up on certain frequencies? If not, what are some of the pass-times? How much packet activity is there on 2 meter? What type of TNC should I get and how much would it cost? I've seen people in this group with what appear to be Internet addresses containing callsigns. Can one connect to Internet via packet?

Also, what is slow scan TV all about? Is it talking normally except with video too? How much does this cost to get into and what bands generally permit this kind of operation? I've already got some video equipment including a camcorder. Am I closer?

For additional info... I'm awaiting a Technician class license. I live in the suburban Detroit, Michigan area. These are generally questions of culture for which I am ignorant. I have a scanner so I can tell what happens on Phone, the others are foreign. Thanks for any info.

: on *small* terminals. Any comments on that? I'm looking for
: a portable packet station. I'll need a QWERTY keyboard, an RS-232
: port, and a decent amount of space on the screen.

Hi ...
I use a HP100LX (CGA full 80 character) with a Paccomm Handipacket.
I can hold the HT, HP100LX and TNC in one hand. I can run a MSYS BBS
(full forwarding, etc.), Procomm or whatever floats you boat (that will
run on a 80186 processor, it doesn't do Windows).
You can easily stash it in a coat pocket or whatever.

"Boatanchors" FAQ
FAQ Maintainer: John Brewer
brewer@anarky.enet.dec.com

Index: * Why boatanchors?
* What is a "Boatanchor"?
* Where can I find one?
* What type of boatanchor should I get?
* Boatanchor Safety
* Boatanchor restoration.
* Where to get parts? ("are tubes hard to find")
* Where can I find more information?
* Where and how do hams operate boatanchor transmitters?
* Typical boatanchors and prices.

Why boatanchors?

Some may question the desire for 80 pound receivers and
100 pound transmitters, both with filaments sitting there
getting hot and wasting power in this day of microprocessor
based, mega-memoried miniaturized transceivers! Although
modern radios are extremely good at what they are designed
to do, they are about as interesting to operate as a
toaster oven. They have no soul.

Additionally, many find a zen-like feeling in taking an
old, misused ratty old radio and carefully restoring it
back to health. Like cars of the era, boatanchor radios
were made to be worked on, modified, and tinkered with.
Many think of it as Real Radio in this era where fixing
a transceiver is accomplished by boxing it up to send to
the manufacturer for a custom VLSI chip replacement.
Indeed, a warm soldering iron is almost a requirement
for operating a vintage station.

Others claim that boatanchors SOUND better than their
silicon descendents, and this is generlly true. The
audio from a Hammarlund or National receiver, or a

Johnson transmitter can sound much better than the
300mW audio coming out of the 2" speaker in the
typical transceiver.

Watching the flicker of 807 modulators in a Viking I
as you speak into a D104 mic, is certainly more stirring
on a winter night than considering hole and electron
flow.

If truth be known, much, if not all of the above although
true, are merely justification for the insatible hunt
for more and more of these old boxes, simply because they
are just too NEAT to have and operate!

What is a boatanchor radio?

Although there are different interpretations of this
term, generally any radio that is "hollow state" or
tube-type is considered a boatanchor. Units produced
from WWII until the mid 60's are probably the most
popular examples of the genre. The origin of the
term "boatanchor" becomes self-evident after carrying
a DX100 (a classic anchor) to your car and noticing
how much longer your arms have become.

Boatanchors may be transmitters or receivers... and
no 'anchor station is complete without an assortment
of like-aged station accessories like microphones,
Transmit/Receive relays, vintage SWR bridges and
so on. All of these items are valid subject matter
for the boatanchor mailing list.

Where can I find a boatanchor radio?

The best way to find a boatanchor is to let other hams in
your area know you are interested in them. Often times
I have been given a boatanchor, because the former owner
has relegated it to the garage or basement. This is also
the cheapest method. When attending a hamfest, ask some
of the sellers if they have any for sale. Often times
sellers won't bring such stuff, as it is HEAVY and is
perceived as not being sellable. Look under the tables,
and in the back of the sellers displays for them! While
you are under the tables rummage thru the boxes of parts
found under there for parts that will come in handy restoring
your new-old treasure. Tubes, high voltage caps, vintage
microphones and connectors may be found lurking here!

If you are in a hurry (and have money) ads in Electric
Radio magazine (see bibliography), the Ham Trader Yellow Sheets,
or your local packet BBS are good places to look. Expect to

pay more through these outlets. Also expect to become an expert in UPS shipping rules. Boatanchors are heavy, and often the cost of shipping one can exceed the cost of the entire unit.

What type of Boatanchor should I get?

This is a question that has as many answers as there are individuals. Generally, as a "starter" boatanchor, 50's vintage gear is probably the best way to go. Radios in this era are quite desirable, but often times won't require extensive surgery to get repaired and on the air.
A radio from a well-known manufacturer is also a good choice... for receivers, look for Collins, Hammarlund, Hallicrafters, and National are all good radios. In the transmitter space, Collins, E.F. Johnson, and Heathkit (with certain reservations) will do well.

Transmitters with plate modulated AM are the more desirable units. Prices will generally reflect this.

Good "starter" transmitters include, but are not limited to:

Johnson: Ranger I or II/Viking I or II/ Valiant/500
Collins: Any 32V series.
Heath: Apache, DX100A or B
(my AM bias is showing!)

"starter" receivers include:

National 183/183D, HRO60 and MANY others
Hallicrafters: Many SX series.
Hammarlund: HQ129, HQ150/160/170/180, Super Pro series, many others.
Collins: any 75A series.

By "starter" radio, I do not mean to indicate the cheapest! Most of these radios would also be on the "best" list. I selected these as they _are_ some of the best, and when one is starting anything, it is good to get the BEST stuff available, rather than getting junk and getting discouraged with it. There will be enough to learn (or remember!) without having to compensate for marginal equipment (was that 'Peak the plate and dip the grid, or the other way around??')! Any radio from this list will do the job for some time, and make operating a pleasure.

Boatanchor Safety

This is a genuine concern! Boatanchor have Real Voltage present in them! Lethal voltages. You will find that capacitors really DO store charge! None of this wimpy 12 volt stuff!

Get back in the habit of discharging any capacitors that
are lurking under the hood. Keep one hand in your pocket
when working on a hot radio. Be REAL careful and THINK THINK
THINK before twiddling with a boatanchor that must be
powered up and worked on.

It is SO easy to get used to working on solid state equipment
and not worrying about Real Voltages... don't do this!

Also, many older radios are not fused... receivers are good
examples of these. I generally replace the line cord
(they usually need it anyway) and either put an in-line
fuseholder, or some of the Heath-type fused plugs in the
radio. Better still, replace the 2-wire plugs with a more
modern 3 wire plug. Barring that, ensure that you strap
every cabinet with healthy sized cable, to a common
station ground. This will prevent _you_ from becoming the
cable between two pieces of gear at different cabinet potentials.

Fires are nice to have burning on winter evenings
but not when they are on top of your operating desk.

Speaking of operating desks, you will become good at carpentry
if you spend much time as a boatanchor operator. You will
quickly discover that the table you used to operate your
tranceiver is way too small, and waaayyyy too wimpy to support
a growing boatanchor station!

Boatanchor Restoration

This subject could easily fill many pages. Below are just some
common topics. The Mailing List is a good place to ask
about other issues. Remember the radio that stares at you from
your bench is old. There are not many around. Take that into
consideration as you proceed through the process. If you
erase the dial marking on your receiver by cleaning it
with Windex, you likely will not find another at Radio Shack.
Take your time and enjoy. The journey to a working boatanchor,
like life, is the _point_ not a process. You will say less
nasty words if you take your time.

[does someone have Jim lockwoods memo about bathing radios?]
[I'll add my $.02 about NOT bathing radios!]

Some general restoration tips:

* Power up old radios gently. Plugging it into the wall and
turning it on is not gentle! Bringing it up slowly to operating
voltage with a Variac so that electrolytics can "form"
is gentle.

* Check fuses before powerup. Many 'anchors will have the
wrong value fuse in it. Checking the fuse before purchase

is a good thing to do too. If it's open, you at least know
what you are getting into.

* Don't trust that the tubes that are in the sockets are the
correct tubes. Check them against the schematic. If you
don't have a manual (and even if you do) note which socket
the tube came from so that you can replace them correctly.

* Don't clean tubes with water. The marking on the glass
will likely come off with one good swipe of a water dampened
cloth.

* Assume many electrolytic and paper caps are bad. Check them.

* Check high resistance, and high wattage resistors for
correct value.

* Nifty tools to have are flux brushes, for cleaning nooks
and crannys. Windex is nice for cleaning chassis.
Qtips are good to have too.

* NEVER clean dial markers or drums. If you do, assume that
they will wipe away never to be seen again. You WILL say
bad words if this happens!

* WD40 or Scotts Liquid Gold (my favorite) applied to a clean
wrinkle finish will do a great job of restoring the lustre.
Works well for knobs too!

* Never use WD40 or Scotts Liquid Gold on anything until you
have tried it on a non-visable part of the cabinet to make
sure it won't dissolve anything.

[------ help me out here... need more 1 liners and general tips-------]

Where do I get parts? (or "aren't tubes hard to find?")

You _will_ need parts to keep or get a boatanchor on the
air. Remember that even 50's vintage radios are 40 years
old.

Fortunately, hams are notorious packrats and parts suprisingly
abound, for old gear, particularly at hamfests (and in the
boxes under the table as mentioned earlier). Word of mouth
once again will work wonders at getting tubes, high voltage
caps, and the like shoved in your direction. Beware that this
is an addiction, and boatanchor radios, parts, and periodicals
will soon overrun all available space. Trust me.

If you are in a hurry, or need to get a radio working
before your hoard of tubes and parts gets established
the list below, taken originally from the ARRL server
may be of help.

This ARRL Technical Information Service handout has been derived
>from the June 1992 QST "Lab Notes" column. Information has been
added to keep it current. You should also periodically check the
ham-classified section of ham and electronic publications.
#
How To Locate Manuals and Documentation
#
"Excellent rig. Needs a little work." How many times have you
passed up a good deal because you were certain you'd never find
the service information? How often have you sent your rig to the
factory for a bug that you could have fixed if you had the
documentation? Mike Gruber, WA1SVF, one of our ARRL Laboratory
Engineers, has searched high and low to find sources for service
manuals and other useful information. In this month's column he
gives you his results.--WB8IMY
#
Q: Why do I need documentation for my radio equipment?
#
A: Unless you're an electronics genius, proper documentation is
often essential to the repair or restoration of any radio
equipment. Even a simple schematic can save hours of time that
would be wasted otherwise.
#
Q: Okay, but is documentation readily available--even for my
antique receiver?
#
A: Believe it or not, there is a good chance that documentation
still exists for almost any radio you're likely to encounter. Your
success in finding it, however, depends on knowing what type of
documentation might be available for your particular piece of
equipment.

```
#
# Q: What types of documentation should I be looking for? Where can
# I find them?
#
# A: Let's save the names and addresses for later and begin by
# taking a look at the different types of equipment documentation
# available. There are several:
#
# Owner's Manuals: An owner's manual is supplied with the unit at
# the time of purchase. It's intended primarily as an instruction
# manual for the owner. It may not contain a schematic and service
# data is usually minimal. Although it's better than nothing, an
# owner's manual leaves quite a bit to be desired should a repair or
# alignment be required.
#
# Manufacturer's Service Manuals: Service manuals are usually sold
# by the manufacturer. They contain vital repair, service and
# alignment data. Most manufacturers supply service manuals for
# their products, although some may not provide manuals for obsolete
# equipment. If you're working with old equipment, it's possible
# that the manufacturer may have gone out of business. Keep this in
# mind the next time you purchase a new rig. Obtaining a service
# manual will take a little extra effort, but you'll be making a
# worthwhile investment in the future of your equipment.
#
# Third-Party Service Documentation: This type of documentation is
# is published by companies other than the manufacturer. It's
# available in several varieties from basic schematics to complete
# service manuals. While modern Amateur Radio gear is usually
# excluded, third-party documentation offers a wealth of information
# on antique receivers and modern consumer electronics.
#
# Q: Wait a minute. You mean that there are companies that publish
# and sell service data for another company's products?
#
# A: Certainly! Some of the most noteworthy publishers--past and
# present--include:
#
# Howard W. Sams & Company Photofacts: Sams started publishing
# Photofacts in 1946 with only 12 employees. Today Photofacts are
# accepted as the standard for accuracy. Complete chassis
# photographs are included and each component is clearly labeled.
#
# Alignment procedures and normal voltage readings are always
# provided. The extensive Photofacts library does not include modern
# amateur equipment, but you'll find service data for some of the
# classic shortwave receivers made by companies such as Hammarlund
# and Hallicrafters.
#
# Photofacts are sold in numbered folders and volumes. To obtain the
```

correct Photofact, you must find the reference number for your
particular piece of equipment in the Photofact Index.
#
There is an interesting sidenote to the Photofacts story. Sams
creates Photofacts from actual product samples. Instead of using
the manufacturer's schematics, the circuits are analyzed and
traced by Sams technicians!
#
John F. Rider Perpetual Troubleshooters Manuals: "Rider's," as
this series is commonly known, was first published in 1930 and
covered radios back to 1926. The first numbered volume, however,
appeared in 1933. New volumes were published at a rate of about
one per year until the last one, volume 23, appeared in 1953.
(Rider's for TVs, however, went from 1948 to 1957, volumes 1
through 18.)
#
Rider's is indexed by a system that is very similar to the
Photofacts. Several index volumes were published, such as volumes
1 to 7, 1 to 10, 1 to 15, 16 to 22 and 23 only. Unlike Photofacts,
however, Rider used service data provided by the manufacturers.
#
RCA Victor Service Data Books, commonly called "Redbooks." These
cover RCA receivers manufactured from 1923 to 1950. The first
volume covered receivers from 1923 to 1928. A new volume was
published each year until 1950.
#
Supreme Manuals: Compiled by M. N. Beitman, these first appeared
about 1930 and covered radios made as early as 1926. One volume
per year was published until the company went out of business in
the 1950s. These generally contain only schematics; Riders and
Photofacts are far more complete.
#
Hugo Gernsback's Official Radio Service Manuals: Six volumes were
published from 1929 to 1936.
#
Mallory Radio Service Encyclopedia: First published in the early
'30s, the Mallory Encyclopedias contained a very complete listing
of radios by manufacturer and model number. In addition, an exact
tube complement was given for each product. This information can
be very useful if you are seeking service data for an old radio
with an unknown model number.
#
Q: Speaking of tubes, what about vacuum tube data? Is that kind of
information still available?
#
A: It sure is! Data for Eimac tubes, frequently found in amateur
amplifiers and other high-power RF applications, is currently
available from the manufacturer. Transmitting tube data can also
be found in the ARRL Handbook; look for it in Chapter 35 if you
have a recent edition. Data books for other tube types, such as

receiving tubes, have been published by several companies. Most of
these data books are no longer in print. Copies, reprints and even
old originals can still be obtained if you know where to look. Two
of the most popular data books for tubes are:
#
RCA Tube Manuals: These are probably the most common tube manuals
-- especially for receiving tubes. Separate manuals were also
published for transmitting, special purpose and industrial tubes.
These manuals first appeared in the 1930s and were frequently
updated.
#
General Electric Essential Characteristics Tube
Data Books: These are similar to the RCA Manuals.
#
Tube substitution guides have also been published by Sams and John
F. Rider.
#
Q: Now that I know what I'm looking for, where can I find the
documentation?
#
A: If you prefer the manufacturer's service manual, start by
contacting the manufacturer directly. If the manufacturer is out
of business, or no longer supplies the manual you need, you have
other options. For example, try obtaining a copy from a manual-
supply company.
#
If you're working with military gear, manual-supply companies are
also good sources. And, some military equipment manuals can still
be obtained from the government. (More about that later.)
#
If you think a Photofact or Rider might be available based on the
age and type of equipment involved, check with your local library.
Many city and university libraries have them and will let you make
photocopies provided that no copyright laws are violated.
#
If your local library can't help you, try one of the "schematic
services" that cater to antique radio buffs. Their prices are
generally quite reasonable. Don't forget to check the hamfest flea
markets and yard sales. Service information can turn up in the
most unusual places!
#
For a difficult case, you might try a classified ad in QST. A
classified ad in a publication that specializes in the type of
equipment involved (such as Electric Radio Magazine\1/ or Antique
Radio Classified\2/ for surplus or antique rigs) may be very
effective.
#
ADDRESSES
#
Q: Come to think of it, I have several radios that could be put to

```
# good use--if they were working! How about those addresses you
# promised?
#
# A: Here they are. Good luck with your projects!
#
# Alinco Electronics, Inc
# 438 Amapola Ave
# Suite 130
# Torrance, CA 90501
# tel 310-618-8616
# Supplies Alinco manuals only.
#
# ---
#
# Amateur Wholesale Electronics
# PO Box 224
# 1040 Industrial Dr
# Watkinsville, GA 30677
# tel 404-769-8706 (technical service and orders)
# Manuals and replacement parts for Azden Radios.
#
# ---
#
# Antique Audio
# 41560 Schoolcraft
# Plymouth, MI 48170
#
# Older factory manuals for RCA, Zenith (including Transoceanics)
# and several others. Riders volumes 1 through 22, Sams Photofacts 1
# through 600, Beitman's volumes 1 through 10 and Sams Transistor
# Service Manuals volumes 1 through 90. The price is $5 per
# schematic up to 8 pages. Fifty cents for each additional page.
# Written inquiries for schematics preferred.
#
# ---
# Antique Electronic Supply
# 6221 South Maple Ave
# Tempe, AZ 85283
# tel 602-820-5411
#
# Antique Electronic Supply supplies pre-1960 service manuals for
# many electronic products, including communications receivers. The
# cost is $4.50 each. A catalog of antique radio parts and books is
# also available. They offer reprints of some older service manuals,
# tube manuals, a tube substitution guidebook and even a ballast
# tube manual. [LOTS of tubes!! /john]
#
# ---
# Ardco Electronics
# PO Box 95
```

Berwyn, IL 60402
#
Manuals for 95% of the Hallicrafters product line. The company was
founded by Anthony Dambrauskas, the Hallicrafters service manager,
when Hallicrafters went out of business in 1978. Today, the
business is being carried on by his son Robert. Manuals range in
price from $7 to $20.
#

Brock Publications
PO Box 5004
Oceanside, CA 92052
#
Manuals for for all amateur equipment sold by Swan Electronics.
Also stocks manuals for Cubic Communications, Astro and Siltronix
products. Brock Publications is a home business owned by Grace
Brock who retired from Swan Electronics/ Cubic Communications in
1990.
#
___
Cardwell Condenser Corporation
80 East Montauk Highway
Lindenhurst, NY 11757
tel 516-957-7200
FAX 516-957-7203
#
Manuals for Hammarlund equipment. In addition, they also have a
limited supply of components for Hammarlund receivers and transmitters.
They also manufacture roller inductors and variable capacitors.
#

Center For Legislative Archives
National Archives
Washington, DC 20408
tel 202-501-5350
#
(Record Group 287) US Army Technical Manuals for radio equipment
manufactured from 1940 to 1979. Photocopies can be obtained at a
cost of 25 cents per page and a $6 minimum order. A "Reproduction
Service Order" must first be completed by the National Archives to
determine the cost of the specific manual you desire. The manual
on this form must be identified by its proper Army Technical
Manual number. If this number is not known, contact your nearest
US Government Depository Library for assistance. (These are
usually the main public libraries in large and medium-sized
cities.) A booklet entitled Indexes and Lists to Army Technical
and Administrative Publications 1940-1979; The National Archives
Microfilm Publications Pamphlet Describing M1641, also available
>from the Archives, describes this procedure.

Jim Farago
4017 42 Ave South
Minneapolis, MN 55406-3528
#
A complete set of Riders, Volumes 1 through 23, covering radios
>from 1924 to 1954. The cost is $3 per copy plus SASE. The customer
must provide the unit name, brand name and model number.
#

Land Air Communications
95-15 108th Street
Richmond Hill, NY 11419
tel 718-847-3090
#
Authorized dealer for Kenwood, ICOM and Yaesu manuals. Also
carries Collins, Johnson, Hallicrafters, National and other
manuals. Can provide schematics on most equipment dating back to
1945.
#

Musty Manuals
HamHeaven Communication Corp
645 Wheeling Rd
Wheeling, IL 60090
tel 708-634-6467
#
An extensive collection of owners manuals, service and maintenance
manuals, catalogs, magazines and other technical facts on all
types of early and late model radio equipment--including ham gear.
Manuals come with updates or articles, product reviews and other
tidbits of information. Catalog available.
#

MECCA
1132 Conway Dr
Newark, OH 43055
tel 614-522-4944
#
Used manuals for test equipment, amateur equipment and early
receivers. Prices range from $5 to $35. Send an SASE with your
request for price and availability.
#

Olde Tyme Radio Company
Suite 317
2445 Lyttonsville Road
Silver Spring, MD 20910

tel 301-585-8776
Some RCA Tube Manuals and Riders for sale. Catalog available.
#

Puett Electronics
PO Box 28572
Dallas, TX 75228
tel 214-321-0927 or 214-327-8721
#
Schematic diagrams "for nearly any radio receiver." Cost is $5
with manufacturer and model number; $15 plus drawing and
description if the manufacturer or model number is unknown.
Reproduction manuals, Rider's indexes, RCA Vacuum Tube Manuals,
and many other service/instruction manuals for classic radios and
related equipment are available. Some amateur equipment manuals
including Collins. Test equipment manuals include Hewlett Packard,
Tektronix, Hickock and others. Also supplies recordings of old
radio shows as well as tubes and other antique radio components.
Catalog available.
#

Radio/TV/Ham Schematics
Alton H. Bowman
4172 East Ave, RD 2
Canandaigua, NY 14424
#
A large collection of manuals and schematics for Amateur Radio
equipment and other electronic products from 1920 to 1970--many
unusual. Welcomes requests for odd-ball material with and without
model numbers or labels. Prices are $5 for schematics and $7.50 to
$10 for manuals. An SASE is appreciated. Alton emphasizes that
this service is his hobby and not a business.

#
------------------------------------------------------------

* Where can I find more information?
---------------------------------

Well, a good place to start is the boatanchors mailing list!
There are quite a few people with quite a few radios here,
and questions are always welcome. Ask away!

Alternate sounces of information:

* Electric Radio magazine.
Highly recommended! _The_ periodical for boatanchor operations.
Whether you are a ham or SWL, or restorer, there is something
in here for you. The classifieds alone are worth the price
of admission. Very professionally produced. Monthly.

Electric Radio Magazine
POB 57
Hesperus, CO.

* Antique Wireless Association.
Although a mixture of general old radio lore, and
communications gear, there is enough good stuff in here
to justify the price of $10 a year. Very nicely produced
and published! Quarterly.

[Address]

* AM Press Exchange

The "original" AM and boatanchor publication. Has been
rather slim in content of late, but interesting to get
if you already get E. Radio. Irregularly.

Don Chester-K4KYV
[address/cost?]
```

Where Do Hams Operate Boatanchors?

On CW you are likely to hear boatanchors lurking anywhere. There are probably more CW boatanchors in operation than anything else.

On AM the following frequencies frequently have AM activity, band conditions and seasonal variations withstanding:

3870-3890 Khz
7290-7300 Khz
14.286 Mhz
21.4-21.45 Mhz
29.0-29.2 Mhz

What are Typical Boatanchors and Prices?

This is a difficult one, as prices can vary from free to many hundreds of dollars. What follows is a list of popular radios and prices one would expect to see in the Electric Radio classifieds.

Transmitters: Collins 32V Series $175-$400
(32V1,2 and 3)

EF Johnson Ranger $90-$175
Viking I $75-$150
Viking II $60-$150
Valiant I,II $150-$300
Viking 500 $400-$700

Heath DX100 $40-$150 *
Apache $50-$150 *

* - Kits. Price should vary widely depending on how it was assembled.

Receivers: Collins 75A Series $125-$600
(75A1, 2,3 and 4)

National HRO60 $175-$350
National NC183D $100-$175

Hallicrafters
[someone help me here with a few models/prices?]

Hammarlund HQ129 $60-$150
HQ150 $75-$150
HQ160 $90-$175
HQ170 $100-$175
HQ180 $150-$250

Epilog

Dont look as boatanchors as an investment. Get a real grimy
specimen and clean and fix, and coax it back to life. Turn
in on with the rest of the room lights turned off. As it warms
up look into the insides and see the orange glow from the filaments
and the purple fire from the 866's. Watch the giant S-meter
come to life, and the dials emit that soft light, framed
by your carefully cleaned and waxed cabinet. Rotate the
knobs that are of sufficient size and layout to permit
easy, flywheel smooth adjustment.

Maybe tune to the BBC on your NC183.... watch the S-meter
climb as the full audio comes out from the 6 watt output stage
as you crank back the RF gain. Fiddle with a few more knobs
(boatanchor operation does not need to ba a passive experience)
to get it set just the way you want it.

Then you'll know why boatanchors are such pleasent
things to own. Like mine, your transceiver may become a
very expensive frequency counter and RF generator used
to align the 'Real Radios'.

From: kq4lo@rbdc.rbdc.com
Message-ID: <3d1ghr$2sr@rbdc.rbdc.com>
Source record: 45796

I recently purchased an Alinco 1200TH2 data radio (factory mod for 9600 baud) and an MJF1270QC TNC with 9600 baud modem. I'm currently experimenting with it and the local node stack that I'm involved with. The node stack is using a Kantronics DVR2 and Paccom Tiny-2 TNC w/current X1J bpqkiss eprom. I'm running bpq just as a node for experimental purposes. My setup seems to xmit fine. I'm in the stack's node list ... no problem ... and if I connect from the stack to home, anything I type back shows up fine. What I'm NOT doing is decoding packets well. Sometimes the tnc gets enough audio from the radio to decode ... most of the time it doesn't. I'm pulling the audio from the mic connector on the radio. WIth the minimal doc that came with the radio, that appears to be correct. If anyone is running this equipment successfully, please let me know how you're configured. Did you have to make any adjustments and, if so, what. Thanks for the help! 73 ...Hal...

4806. Help- looking for DTMF decode prog

>Internet via packet?

Packet is somewhat like an ethernet without the wires. You'll find many
of the sorts of things you find on internet on packet radio (depending
on the interests of the local area), BBSs, newsgroups, file transfers,
etc. The big differences are that it's wireless, and in most cases it's
slow compared to what you are used to over the telco network. The biggest
shock most people get the first time they try packet is how long it takes
to do anything. The 1200 baud packet system is *really* more on the order
of 300 or even 50 baud effective throughput after allowing for several
relays, packet collisions, and the turn around time of the half duplex
system. There are internet gateways from the amateur systems, but because
most of the amateur network is so slow, about all you can use them for
is non-realtime Email.

It doesn't have to be this way, and it isn't in some local areas. There
are systems that operate at 9600 baud, 19.2 kbaud, and 56 kbaud available,
but they don't do you any good unless a *group* of hams all decide to get
them. In most areas, the default 1200 baud equipment is standard, and
slow, but in a few areas the faster equipment is in use. The 56 kb equipment
for example has a throughput very near to 19.2 kb telco modems after
subtracting all the turn around and packet overhead. That's very usable,
and you'd feel pretty much at home with that. At the lower speeds, your
operations will be very different from what you are used to via telco
modems.

>Also, what is slow scan TV all about? Is it talking normally except with
>video too? How much does this cost to get into and what bands generally
>permit this kind of operation? I've already got some video equipment
>including a camcorder. Am I closer?

Slow scan is the sending of still pictures over radio. The B&W standard
takes 8 seconds to send one frame. The color standard takes longer.
You can't talk while sending or receiving a picture, but you can talk
in between pictures. This activity is mostly on HF with SSB radios, but
you could do it at VHF/UHF with FM radios if you find someone else interested
in trying it. At UHF, however, you can send real TV, normal fast scan
pictures like your local broadcast station does. There's a fair amount
of activity around the country with this. Since this is UHF, the activity
depends on what local hams are doing. You can also exchange still frames
via packet in GIF format, for example.

>For additional info... I'm awaiting a Technician class license. I live
>in the suburban Detroit, Michigan area. These are generally questions of
>culture for which I am ignorant. I have a scanner so I can tell what
>happens on Phone, the others are foreign. Thanks for any info.

Since most of the activities you'll be doing will be local (other than
amateur satellite, your license won't allow you to reach far out of the
local area with these modes), it's important to join with the locals and
see what they're up to before investing a lot in equipment. Find and
join a local ham club. Different ham clubs have different interests
and personalities, shop around for one that fits with your interests.
If people aren't doing something you are interested in doing, then
you can take the lead and sell others on trying the mode. Remember
that when you get beyond FM voice, activities in other modes are
a group effort. You've got to build interest and cooperation among
other local hams in order to do high speed packet networking or
ATV or any of the other more technical modes.

Hello all--

Just making a plea for someone with experience moving mail via SMTP over wired SLIP and wireless AX25 links to contact me to give me a hand. In particular, using the wired SLIP connection as a POPserver.

I have a machine ready to be dedicated to full time AX25 access and a portable that I will use for all my mail reading/responding. I've been able to telnet bidirectionally, but my SMTP sessions are failing and mail is not moving back and forth. My goal is to not have any mail kept for reading on the gateway machine; it will only move mail between the AMPRnet and my portable. I tried to create the appropriate entries for the gateway machine to accept and deliver mail for the portable, but it just won't go.

As an aside, something that surprised me was that in order to get a packet out from my portable over the air (well, at least out to the TNC for broadcast), I needed to telnet to and sign into the gateway machine, and then access the port with the TNC on it. I couldn't CONNECT to any stations through the SLIP connection, even if it was ROUTE ADD DEFAULTed. I left the gateway machine in TRACE mode, and sure enough, the packet queued for output over the TNC showed the portable as the source machine even though I was telnetted to the gateway machine.

So if anyone who moves mail between the wireless network and any wired machines via SLIP connections can take a second to dump some data my way, I'd really appreciate it.

Many thanks in advance.

Steve (*still* waiting since 9/10/94)

From: tedwards@Glue.umd.edu
Message-ID: <3d3gsh$ej5@thrash.src.umd.edu>
Source record: 45824

I've been monitoring some connected mode packets using KISS, and
I can't see where the Frame Check Sequences (FCS) have gone. Does
KISS filter them out? It looks to me like the text runs all the
way up to the C0 FEND character KISS sends back to indicate the
packet is over. I know KISS doesn't send nor require the
packet FLAG (7E) characters, I wonder if it magically gets rid of/
adds the FCS.

Now the next interesting question is whether KISS will report
packets that don't pass the FCS? (like PASSALL ON does with
regular TNCs).

I notice TRACE ON on regular TNCs doesn't report the FCS either...

Anyway, I managed to get a home-grown program to send out a packet
in KISS mode that made a regular TNC think it was a UI packet.
Then I got it to accept an I packet also...I never added the
FCS to either, so that is what got me thinking along those lines.

Over here in the Netherlands they are in very wide use, and you can get
kits and even assembled ones from many sources. They can normally be
attached to a disconnect header, although we usually have them on an SCC
card because that is so much more cost-effective and works better than a
TNC.

I think a $100 price for a G3RUH modem will be a kit, and probably for
only the board (no enclosure, supply etc). When comparing on an equal
basis with the HAPN modem it will be below $50.

Thanks for the info Rob. Now I want to ask about the SCC Card. :) Is
that a Baycom SCC card I've heard about? Where can I get more info on the
SCC card you like to use? How much do those things cost, compared to a
TNC. In the US... we can get a TNC-2 clone (MFJ-1270c) for around $120
and a G3RUH modem is pre-built, ready to go, board for around $105. It
drops into the TNC-2 and plugs into the modem disconnect header.
I haven't had 100% success with 9600b on 2 meters. I'd like to try a
4800b link to see if through put is better of a good 4800b link compated
to a marginal 9600b link.
Also... I'd like to look at using a SCC card instead of a TNC-2 clone.
I've heard that there is a 4 port, Baycom SCC card but haven't seen
anything that talks about it, how much it cost, where to get it, etc.
Anyway if you (or anyone else) can tell me where I can fing ordering
info for SCC cards or HAPN modems, I'd appreciate knowing about it. Thanks.

It's called the USCC card, and it is available in the UK for about
250 pounds or so.
It has 4 ports - 1 off 7910 300/1200 baud
1 off 3105 1200 baud
1 off RUH clone 9k6 (and other baud rates)
1 off space (a disconnect header)

It comes with software. Software than knows about it includes the
G8BPQ Packet Switch, later JNOS versions (after I updated SCC.C),
and Linux drivers.
I might be modifying the PI card Packet Driver to work with the
USCC card, but my first project is a double-headed Packet Driver
(so that one can use the Trumpet Winsock stack to talk to NOS on
the same machine).

I have a USCC card, and I'm very happy with it.

I am currently running WNOS4 at my home station. I have seen some articles posted here that mention Linux and AX.25. My question is, does Linux route TCP/IP calls to the AX.25 protocol which is used on packet? And, if so, is Linux a more stable platform to use than WNOS? (I have had some problems running WNOS in the past, and wanted to find something that would accomplish the same things while allowing me to do other things one the same computer.)

Any help is greatly appreciated!!!!

4821. FBB Documentation

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-19 17:24:44 UTC
From: mweitzen@coho.halcyon.com
Message-ID: <3d4fks$149@news.halcyon.com>
Source record: 45812

I'm relatively new to packet but trying to learn. The Radio Club of Tacoma is running the F6FBB BBS system. They've recently been having some operating difficulty with the software. I believe it is just installation/configuration issues. Nonetheless, they cannot locate any documentation for the BBS software. Anyone out there that could point me in the right direction to find documentation?

Thanks a lot!

73, KC7FAA

4825. Any Windows programs for the KAM?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-19 22:11:27 UTC
From: Ned Raybould <eraybould@delphi.com>
Message-ID: <xO30vcv.eraybould@delphi.com>
Source record: 45816

I was wondering if there was a Windows-based program for the Kantronics KAM all-mode TNC that behaved similarly to the Hostmaster II+. I enjoy having the the different "windows" for each packet conversation and the command mode, but would desire a program that is not DOS-based. I know that someone (AJ8B, I believe) has written a program for another brand of TNC using Visual Basic, but this needs to be for the KAM. I appreciate any help that you can give me. Please send replies via e-mail to erayboul@dnaco.net.

Thanks and 73's

>and a G3RUH modem is pre-built, ready to go, board for around $105. It
>drops into the TNC-2 and plugs into the modem disconnect header.

There exists an SCC card from Baycom, which is already mentioned in another
followup. It includes modems, which can be convenient to the end-user but
is usually not so convenient when building a node. I think they have a
special card for that.

In the Netherlands, many people use the so-called OptoPcScc card which
has been designed by PA0HZP and myself. It is a four-port card without
modems, but featuring optocoupler isolation of the digital signals. This
has some advantages w.r.t. grounding loops and surge protection.
The card goes for the equiv. of about $100 as a kit. Modems that have TTL
interface can be easily connected using a simple interface consisting of
a 74LS14 and 4 resistors to interface to the couplers.
Modems with this interface on-board are available for 1200, 4800, 1200+4800
and G3RUH-type (9600 or higher) locally. Prices range from about $25
to over $100 (I am not sure about the G3RUH price but I think it is well
over $100. there are quite some components on that modem, and some are
expensive. When you see a modem for significantly less, make sure it is
a genuine G3RUH modem and not a K9NG, which does not have the digital
filtering)

For a single 1200 bps channel the above kit is about the same price as
a TNC (about $130 total), but the advantage becomes clear when one wants
to operate more than one channel. E.g. 1200 bps on 2 meter, and 1200+4800
or maybe even 9600 bps on 70cm as well. In that case one SCC card and
a couple of modems is a lot less expensive (note that you don't need COM
ports either, which saves as well)

The PA0HZP OptoPcScc card has vectored interrupts, and a single interrupt
can be shared with 3 cards, yielding 12 channels. It is in wide use in
nodes in the Netherlands in this configuration. (2 or 3 cards)

> I haven't had 100% success with 9600b on 2 meters. I'd like to try a
>4800b link to see if through put is better of a good 4800b link compated
>to a marginal 9600b link.

The main difference between HAPN and G3RUH is that HAPN does not need the coverage from 10Hz. This makes it a lot easier to use with FM-only PLL synthesized transmitters. It can even be used with Phase-modulated transmitters.
When you are using such a transceiver (PLL) the switchover to HAPN will give a lot better eye-pattern and thereby better performance at lower signal levels. When your transmitter is already performing well (crystal controlled or all-mode transceiver) the difference is less clear, and will probably be offset by the lower datarate.

> Also... I'd like to look at using a SCC card instead of a TNC-2 clone.
>I've heard that there is a 4 port, Baycom SCC card but haven't seen
>anything that talks about it, how much it cost, where to get it, etc.
>Anyway if you (or anyone else) can tell me where I can fing ordering
>info for SCC cards or HAPN modems, I'd appreciate knowing about it. Thanks.

Ordering the OptoPcScc card described above can be done through PA0HZP.

Actually, I've given this considerable thought. For one, I did get some V.29 modem chips (16QPSK) working over amateur radio circuits. (written up in a 1991 issue of PSR, sometime in the fall).

However, V.29 is a half duplex format, this doesn't answer your question.

For V.32bis/V.34 you'd need to go with a full duplex path. Actually, with the complex line negotation process both go through, the only real value would be in full time dedicated links or possibly some sort of broadcast mode.

Actually, I'm working on a circuit now to try and make this work. First off, you'd need to provide a full duplex path (two radios and/or duplexers) so this in not for Joe Ham. My application is a link, so this doesn't matter.

The circuit basically would 'trick' the phone modem into thinking it was talking to a phone. A two to four wire hybrid would be the heart of it. 'Offhook' would control PTT. The squelch breaking on the radio would generate a 'ring' signal.

Here is the operational scenario (for use with KA9Q NOS/ Slip link):

NOS box #1 wishes to establish a slip link with NOS box #2 (over a RF path).

#1 issues a 'dial command' to the modem (which goes off hook, triggering PTT on radio #1)

Radio #2 (paired with NOS box #2) squelch breaks. This generates a 'ring' signal that causes modem #2 to 'answer' the phone, thereby asserting radio #2's PTT.

#1 sees the 'answer tone` from modem #2, and the process proceeds just like a normal V32/V34 negotiation process.

The KA9Q allows you to ping a host from time to time and issue a redial command in case you lose the connection. This could be used to periodically check the link and retrain if needed.

The short answer to your question, is V32bis/V34 technology is not really pratical for most amateurs use due to extremely long training times.

V.29 however is another story. I orginally gave up work with this due to the percieved 'long' training times this had (253ms). However, I'm finding that this may not be as 'long' relatively speaking, as I was lead to believe. I base this on the observation that most amateur operation, at least in my area (Michigan) at 9600 baud, are using TXD's in excess of 400ms. This is due to slow radios and hopefully will change in the near future.

V.29 in case you wondered, is what is used in FAX machines and it on many phone modems.

Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.antenna,rec.radio.amateur.homebrew,rec.radio.amateur.digital.misc,rec.antiques.radio+phono,sci.electronics

NOTE: The BOATANCHORS elist moved to a new host. Below is the greetings sent this weekend to current subscribers. If joining the BOATANCHORS list is of interest to you, you ought to read the greetings.

In a subsequent message, I will broadcast the procedure for subscribing--now that it can be handled entirely by email to the list management program running on ThePorch.com.

--de Steve AB4EL ab4el@Cybernetics.NET in Raleigh, NC
----------------Cut Here----------------

BOATANCHORS CHANGEOVER RELAY GOES "KER-CHUNK"!!!

Greetings and welcome to the new and improved (but still vintage) "boatanchors" mailing list. An automated list manager should help things run more smoothly for everyone while still providing the same outstanding signal-to-noise ratio we have enjoyed since the list's beginning.

Jack Hill W4PPT has agreed to provide a new home for the list, with the blessings of Paul Prescott N1AAC who took over from Our Esteemed Founder Jim Lockwood KM6NK.

NOTE - You need not re-subscribe or take any special action other than noting the new addresses listed below. The subscription list was moved intact from the old mit.edu site and you are already on it if you got this message.

Subscribers of the satellite list on boatanchors@beacons.cts.com will also be moved to this new address.

The new mailing list address is now

boatanchors@ThePorch.com.

Use this now for messages of general interest to the entire group
Please don't use it to subscribe, change address, etc.

The new automated list manager address is

ListProc@ThePorch.com

Use this for subscribing, unsubscribing, getting archived info,
getting the FAQ message, changing your address, etc.
Now send a message to ListProc@ThePorch.com with just
HELP in the body to get info on how to do this.

The new list owner address is

ListOwn@jackatak.ThePorch.com

Use this address only when there is a problem which really
truly can't be resolved otherwise.

Now, yes right now, save this message so you'll have these addresses
handy. Whew, thanks - doesn't that feel better?

You will also soon receive a copy of the "Welcome" message that will be sent
to all new subscribers. It includes more useful info on things like the
purpose of the list, how to subscribe/unsubscribe, etc. It would be a
good idea if you save it along with this message for future reference
or to pass on to interested parties. Thanks.

The transition team has included long-time boatanchorites and folks who
have been helping keep "boatanchors" alive over the last couple of years.

We have tested this program on a variety of mail programs, but we know that
it is possible some behavior may be different (particularly in how you reply
to just an individual or to the entire list). There seems to be no way to
satisfy all possible e-mail software! Just relax, keep your eyes open, and
adjust your habits accordingly.

We hope that we'll all now have a stable, reliable, and useful list with
a minimum of disruption. Enjoy.

Happy Holidays and 73 from the transition team.

Jack W4PPT Larry KQ4BY Phil at theporch.com
Steve AB4EL Kevin KN6FQ Jim KR1S

Have you tried asking the sysops of the 20 or so other local FBB BBS systems in the Seattle/Tacoma/Olympia/Vancouver area?

If a request to them did not result in any useful response, try posting a message to SYSOP @ PNW, I'm sure one or another of us will be able to help you, once we know what your problem is.

|> I've been monitoring some connected mode packets using KISS, and
|> I can't see where the Frame Check Sequences (FCS) have gone. Does
|> KISS filter them out?

Yes, it does filter them out on receive. They are also added automatically on transmit. The FCS is generally handled in hardware by the SCC or SIO in the TNC, and they don't appear on the asynch link.

|> Now the next interesting question is whether KISS will report
|> packets that don't pass the FCS? (like PASSALL ON does with
|> regular TNCs).

No, not unless you modify the SCC or SIO driver code in the TNC to do this.

Documentation and the software itself can be found by anonymous ftp to
ftp.ucsd.edu in the /hamradio/packet/f6fbb directry. The docs, I believe,
are contained in one of the zip files in this directory. Hope this helps.

Not sure but I think it may be R0MIR. I also believe that MIR operates on
simplex 145.550 for packet and FM voice. I stand to be corrected, as I
would like to verify this myself. I've digipeated through it but that was
a couple years ago.

Message-ID: <mmunster-2012940938080001@mmunster-mac.qualcomm.com>
Source record: 45837

I don't want to start a war here, but if you had it to do all over again, what TNC would be best to build a new network. I want to use one "brand" of modem that will fit all applications.

Considerations:

X1J/2
1200 user port
9600 and _up_ network
Power sources (12 volt DC pref., low current?)
Hill top operation (not in a house - you know, temp. stability, etc.)
Standardization (same equipment at all sites)
Cost - (best bang for the $)
(add your own here)

Lets hear it all, good or bad; should or shouldn't; do or don't.

Don't forget to say why you like it or dis-like it.

Thanks for your input and thoughts on the subject.

Message-ID: <mmunster-2012940941340001@mmunster-mac.qualcomm.com>
Source record: 45836

I am seeking information on the pros and cons of a packet repeater.

What are the settings required?

Is bit regeneration a necissity?

Operating experience?

Porting a BBS into the repeater?

This information is needed to convert an old voice repeater with all of
the equipment associated, like duplexers etc.

I would appreciate any information.

With the framing is the same, the standard windows software will not
be enclosing the data in AX.25 packets, which is used for various reasons
(eg third party traffic rules, "hardware" addressing/packet filtering,
etc). Some people use a dedicated old-iron box to convert from slip
or eithernet to radio protocols.

The only way to go is with a TNC-2 type TNC. This will let you add a
9600b modem, Networking EPROMs, software DCD, etc. I own several MFJ 1270b
tncs, and a couple of PacCom Tiny-2 TNCs. I prefer the PacComm TNC and
it's about the same price as the MFJ tnc.
PacComm builds both the PacComm and MFJ 9600b modems. The PacComm
version is a leter design so I'd recomend that. On the MFJ 9600b modem,
if you want to go to 19.2kb, you've got to locate/unsolder/replace several
resisters and capacitors. On the PacComm TNC, you unplug a DIP header that
has all the resistors and caps attached and replace it with a different DIP
header that has the stuff for 19.2kb.

> Thanx a million to whoever does.

Well, to begin with. You need an amateur radio operators license. For packet radio the no-code Tech is good enough because most of the networks and frequencies that you would use are up in the vhf and uhf range. You would then need to obtain the proper radios and tnc (terminal node controler) equipment to interface your computer to the radio networks.

As far as the IP address goes, you would have to contact your state IP address co-ordinator and get the proper address for sub-net area.

It is all not very difficult, but it does take some personal effort to get things started and to continue on with it. I am 54 years old and I do it. In fact, packet radio using the tcp/ip protocols is one of my favorite modes of communication. So there is only one thing that I can tell you. Look up your local ham radio group, go to a meeting, find out who the packet guys are and introduce yourself. Study for the test to get the ticket and then just *****GO FOR IT******* I guess is the best advice that could be given to anyone.

If you mean TNC settings, it would depend on the setup of everything.

>
>Is bit regeneration a necissity?

At 9600, the word is generally yes. TAPR's 9600 modem has a regen
option.

>
>Operating experience?

We've got a 9600bps repeater running TCP/IP in north central Massachusetts.
Users are able to run low power, and there is no hidden transmitter
problem. The channel is able to cook along at decent (for radio) speeds.

>
>Porting a BBS into the repeater?

A BBS can be just another system using the repeater. It does not have
to be AT the repeater site. It is possible to co-locate them and
attach the BBS to the repeater's modem/tnc, but not essential. If
no BBS is present, it's not clear how much of a TNC is really
required (perhaps just a bit regen?).

>
>This information is needed to convert an old voice repeater with all of
>the equipment associated, like duplexers etc.

Split your audio path with the bit regen. Don't know what else
is needed for your gear. Nice thing about bit regen is no voice
will be repeated...

>
>I would appreciate any information.

For anything further on the system near here, I think the fellow
who runs it has access to email via a packet/internet gateway. I
don't know his address offhand, but could probably find it.

: talking to a phone. A two to four wire hybrid would be the heart of it.

A hybrid is what you don't want. Ever wonder where an echo comes from
on a phone line (such as a satellite link), it's hybrids that cause
echos. Bypass the 2 wire circuits completely and just rip it right out
or you could be asking for problems. Run straight 4 wire like it's
supposed to be. The only reason a hybrid circuit is builtin to modems
is for it's use on standard 2 wire lines. Radios are typically 4 wire
and no hybrids are needed.

: V.29 however is another story. I orginally gave up work with this due to the
: percieved 'long' training times this had (253ms). However, I'm finding that
: this may not be as 'long' relatively speaking, as I was lead to believe. I
: base this on the observation that most amateur operation, at least in my area
: (Michigan) at 9600 baud, are using TXD's in excess of 400ms. This is due to

Actually most people in this area (in Michigan) don't operate anything
higher than 300 ms maximum. Of course they only get about 200-300 bps
when I get 550-650 cps average on 9600 packet (I run 80 to 100 ms), 400
range on a bad day or when someone runs a high txdelay. I won't even
support anyone that requires a txdelay of more than 200 ms, and most
Alinco radios fall into this range, including the 9600 setup that most
SE Michigan hams are running. That's the reason why they usually run
200-300 ms txdelay, but I know of noone running higher.

You should find all the connection info you need in the PK-232 manual.
When I worked there I did a major update (and improved the
maintainability) of the radio connection info.

> Any pointers on how to hook these up? I would appreciate the help, so
> I can get suplies ahead of time (resistors,caps) if needed! I have a Mac SE.
>
For the Radio Shack HT, you will need a 2.2k resistor and a .01 to 1.0
uF capacitor, along with the 2.5 and 3.5 mm plugs.

I don't recall enough about the FT-301 - you may be able to use use a
microphone plug. If the radio has FSK inputs, these are recommended, as
are using rear-panel connectors (such as are frequently available for
phone patching) on the radio.

For the Mac you will need a standard Hayes modem to Mac serial cable.
Because of the small number of connections in such a cable, it's
unlikely you will have a problem with it, but beware that the DB-25
connector on the PK-232 uses the 'extra' pins to implement a parallel
printer port. To prevent damage to the PK-232 make sure the cable you
use connects only pins 1,2,3,4,5,6,7,8,20 to the PK-232. If you are in
doubt, connect your cable to the one supplied with the PK-232, then plug
the other end of that cable into the PK-232.

> I am still looking for the "perfect" terminal program so please E-mail me for
>
Sorry - no real help there. I used AEA's product, but it has not been
upgraded in a long time (and won't be, at least by the same author) and
does not support a number of the newer features of the PK-232MBX.

What you probably need here is an 'arp publish' entry. Without this, a
station trying to answer will not know what AX25 address to use to reach
the portable. Arp publish tells your gateway to 'answer up' when an
on-air station sends an arp request for the portable computers' address.
The general form is:

arp publish <portable's IP addr> ax25 <call of gateway> <interface
name of on-air port>

It's really important to make sure the <call of gateway> matches what is
shown in the 'Link addr' field of the ifconfig display. In this case
NOS sends out exactly the call you specify, and if it does not match,
NOS will blithfully ignore the non-broadcast TCP and IP packets that you
want it to route to your portable. Note that this same info applies to
using ethernet cards, etc. Just think of the ethernet circuit as a much
faster slip...

> adds the FCS.
>
Actually, the hardware HDLC chip is usually what filters out the FCS.
It keeps a running computation of the CRC, and when it gets the trailer
flag for the frame, compares its calculations with the 2 bytes
preceeding the flag. The results set a bit in the status register of
the HDLC chip that the TNC firmware can use to decide if the frame is a
'keeper'. Whether the CRC bytes actually make it into the ram of the
TNC probably depends on the HDLC chip.

> Now the next interesting question is whether KISS will report
> packets that don't pass the FCS? (like PASSALL ON does with
> regular TNCs).

PASSALL might affect the TNC's decision in the matter. I've never tried
that - I don't need any more bogus callsigns in my heard list than I
already get.

I know Virtuoso and Savant, also NETMac (TCP/IP). But these programs all use the KISS Mode. I've got a TNC2 with TF 2.6. I can use it with a terminal-program (Zterm 1.0b3) without problems. But is there a program which supports the WA8-Hostmode? There are many of them on the PC, but on the Mac?

I'm trying to understand how Direct Digital Synthesis (some people call them Numerically Controlled Oscillators) work, and am having a real problem with figuring out how the 'phase accumulator' section works in conjunction with the 'look-up' ROM.

I've got the following references:

"A Digital Frequency Synthesizer", by Sheetz, in April 1984 'QST' plus corrections to the above article, "Feedback" in June 1984 'QST'

"Direct Digital Synthesis", by Bergeron, in Summer 1993 "Communications Quarterly"

The 4 part "Direct Digital Synthesis" series, by Hickman, running in the August through November 1992 issues of "Electronics World + Wireless World"

The 'Techno-Whizzy' articles (the original + computer intfc.) in "73 Magazine"

The 'Kendra' article, plus the 'sister' article in "73 Magazine"

The March 1991 "QEX" is supposed to have an article, but I haven't read it yet.

Has anyone had experience with Qualcomm or Sciteq? I've called Qualcomm, and left a voicemail message, but so far no response.

The series in 'Wireless World' seems to have, by far, the best description, but I'm still struggling, apparently missing some basic understanding of how the 'frequency tuning word' and phase increment' are related, and how they result in the ROM 'look-up' being read out to the D-A converter.

I'm fairly sure that I'm just 'missing' some particular detail, but I've read-and-reread all but the 'Wireless World' articles (just got them yesterday), and it just hasn't 'clicked'.

If anyone can 'point' me to further references, or can offer advise, it would be appreciated.

>option.

Another thing to consider... when you go the bit-regeneration
option,,, everone of the freq can adjust their TNC to talk to a single TNC
and listen to a single TNC. If you use a simple audio repeater... some
users will be able to talk to other users and won't be able to talk to
others. Haveing a single TNC to communicte with helps.
On the downside... (and maybe upside) if you have a 1200b
Bit-regenerater going, you can't do any other speed at the same time. With
an audio repeater, you can. Un fortunatly... most TNCs don't listen for
signals sent at other baudrates so they'd end up talking at the same time.
I'd go with the bitregenerator if possible.

> -
> VICTOR MORANGE, DDDP59B@prodigy.com, tmorange@delphi.com, KE6MWA

External. External modems/TNC's are far more flexible than internal. You can leave the external running 24 hours w/o computer and provide a useful service to your friends as a digipeater. Also mail can be left on your TNC. If your station gets hit by lightning it would be harder for an external TNC to damage your computer.

As for the included power supply: just use the same thing you use for your radio. As for included software: you want to try several packages before you know what you want.

Also a major concern is that internal TNCs are not Macintosh compatible.

4870. Kam survey

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-21 18:35:21 UTC
From: mutual.advantage@filebank.COM
Message-ID: <9412211035.0EVJ800@filebank.com>
Source record: 45713

If you use a Kam for any of the HF digital modes, please take a moment to respond to this survey. I will post the results to the reflector, so unless you have major editorial comment to offer on the survey, please respond by direct email to:

Stan.Huntting@filebank.com

The Kam offers significant flexibility in selection of the afsk tones used to modulate and demodulate digital signals. I am interested in how Kam users employ this flexibility in their operating.

The "SHIFT" command of the Kam has two setting that are of primary interest to hams: "170" and "MODEM". "SHIFT 170" fixes the afsk tones at 2125 Hz and 2295 Hz for mark and space respectively. "SHIFT MODEM" sets the afsk tones to the current values of the "MARK" and "SPACE" parameters which accept values in the range 50-4000 Hz.

My questions are these:

For each HF digital mode that you active on (G-tor, Pactor, Rtty, etc.)...

1) What make and model HF transceiver do you use with your Kam?

2) What transceiver mode do you use (LSB, AFSK, RTTY, Packet, etc.)?

3) What Kam "SHIFT" setting do you use ("170" or "MODEM")?

4) If "MODEM", what "MARK" and "SPACE" tones do you use?

5) Given the configuration just defined, what is your understanding of the significance of the frequency displayed on the front panel of your transceiver? And, what is the relationship between that displayed frequency and the RF frequency of either of your radiated mark or space signal (e.g. "display shows mark frequency", or "display shows center frequency between mark and space", or "display shows lsb which is mark plus 1700 Hz", etc.)?

The intent of this survey is information gathering - not flame kindling - if the survey touches a sore point with anyone, I'm truly sorry - that's not the intent. Thank you.

Igottago, 73 de KF0IA ..

>it would be appreciated.

I'll just give a rudimentary description and maybe that will help congeal what
you have already read.

There are really only two fundamental parts to a DDS/NCO, the phase
accumulator and the lookup ROM. If you wanted to build your own, you can do it
with a latch and an adder (the phase accumulator), and a ROM.

The ROM contains one full cycle of a sine wave. If you just hook a counter on
the address input to the ROM, you get out the sine wave at a frequency
determined by the clock rate to the counter and the length of the ROM table.
If you want to double the output frequency you can either double the counter
frequency or have it increment by two instead of by one. You can quadruple the
frequency by having it increment by four instead of one. You can actually even
cut the frequency in half by using a counter with the LSB not connected to the
address bus.

Instead of using a counter, then, you can use an adder that successively loads
the sum of whatever was just in the adder with the contents of some fixed
register (or latch). If the register contains a 1, then the contents of the
adder will always increment by one every clock cycle which is just like the

first case with the counter. With the adder, though, you can increment by whatever number you like, 1,2,3,4, etc., to control the increment rate of the 'counter', which is now the phase accumulator. Most DDSs have bits that run far below the actual used address bus of the LUT. This means you can increment by fractions of a LUT address every cycle for fine control of the output frequency.

The remaining tricks in DDSs are generally ways to help cut the quantization noise in the output, the possibility of multiplexing more than one register (increment value) to the phase accumulator, and a few other things like that.

Hope that helps...

the text that follows is from CCITT Recommendation X.25 -- I checked
and ISO 3309 is almost word-for-word identical. the only difference is the
quickie introduction to cyclic codes in the first paragraph of the X.25
specification, and the ISO 3309 mentions a 32-bit extension (see below).

>2.2.7 Frame check sequence (FCS) field

>and the FCS, will be 0001110100001111 (x^15 through x^0, respectively)
>in the absence of transmission errors.

[**] "transparency" is the insertion of "0" bits after a consecutive
string of five "1" bits.

Appendix I (to the Recommendation X.25) provides some simple examples.
i have removed the "transparency" bits -- they aren't part of the FCS
calculation.

> APPENDIX I
> (to Recommendation X.25)
>
>---flag-- -address- -control- --------FCS-------- --flag---
>0111 1110 1100 0000 1111 1100 1101 1010 0011 0111 0111 1110
>0111 1110 1000 0000 1100 1110 1100 0001 1110 1010 0111 1110
>0111 1110 1000 0000 1111 1100 1101 0111 1111 1011 0111 1110
>0111 1110 1100 0000 1100 1110 1100 1100 0010 0110 0111 1110

ISO 3309 also specifies a 32-bit CRC -- use is by "prior agreement
in those cases that need a higher degree of protection than can be
provided by the 16-bit frame checking sequence". identical semantics
as for the 16 bit version, except the FCS is 32 bits long and you use the
polynomial:

x^32 + x^26 + x^23 + x^22 + x^16 + x^12 + x^11 +
x^10 + x^8 + x^7 + x^5 + x^4 + x^2 + x^1 + 1

and the check value (on receive) is:

1100 0111 0000 0100 1101 1101 0111 1011

as amateur packet networks get faster (we can always hope), and packets
get longer, this 32 bit FCS may be an Idea.

in any event, CRC calculation functions are available in many places.
check the source to the GNU "gzip" and "gunzip", the "zip" and "unzip"
programs (which read PKZIP files) probably have some, i recall seeing
some in the source to zmodem as well.

and CCITT/ISO standards can probably be found in most university libraries.

TAPR 1995 Annual Meeting to be held in St Louis

TAPR 1995 Annual Meeting * March 3, 4, & 5 * St. Louis, Mo

Join some of the brightest and most enthusiastic of today's packet developers/users, with a weekend full of Packet Radio and Digital Communications talks, presentations, SIG meetings, and two SPECIAL Sunday Workshops. In addition, an advanced DSP symposium is planned for Friday, March 3rd.

TAPR 1995 Annual Meeting

TAPR's annual meeting will be co-hosted by MoAmPS (Missouri Amateur Packet Society) on March 3rd, 4th, and 5th, 1995, in St Louis, Mo. TAPR (Tucson Amateur Packet Radio), a non-profit research and development corporation, works on the advancement of digital communications and education. This year's annual meeting will be the first held outside of Arizona and presents a unique opportunity for those unable to travel to Tucson to attend meetings.

The annual meeting informally begins Friday afternoon with the opening of the hospitality suite and continues later that evening with dinner. Dinner is always low-key and provides a great opportunity for those who arrive Friday to discuss and chat about projects before the rest of the weekend begins. Friday evening, after dinner, the Regional Networkers Special Interest Group will met.

An advanced DSP symposium will be held Friday, March 3rd starting at 3pm, through dinner (which will be provided), and concluding sometime that evening. The purpose of the Friday symposium is to bring developers of DSP technology together to discuss future directions and technology. The DSP symposium will be conducted by Jon Bloom, KE3Z.

The annual meeting formally begins Saturday morning with presentations and papers, as well as discussion on other projects of interest throughout the day. Issues concerning packet networking and BBS operation are also anticipated. Lunch will be up to the participant this year. Facilities at the College will be available to cater individual tastes. Dinner will be held after the Saturday afternoon session and will include a prize drawing. After dinner, Special Interest Groups will meet and discuss issues.

On Sunday, two workshops will be held. One will focus on Error Correction Techniques, by Phil Karn, KA9Q, while the second will focus on higher level interests for the development of hardware/software for the TAPR/AMSAT DSP-93, by Bob Stricklin, N5BRG.

These are exciting times for digital communications and TAPR. This year's meeting should be a super-charging event for everyone who can attend!

Call for Papers

Papers are welcome from everyone. Although there is limited time during the weekend, all attempts will be made to allow those present to talk. Deadline for submission of papers is Monday, February 7th, 1995. Contact the TAPR office to request an author's information package.

Meeting Place and Hotel

The TAPR Annual Meeting presentations, meetings, and workshops, will be held at the St. Louis Community College at Florissant Valley. Lodging will be at the Henry VIII Hotel and Conference Center, 4690 North Lindberg Blvd, St. Louis (Bridgeton), MO, 63044, Phone (lots of them): 800-325-1588, 800-392-1660 (in MO. only), 314 731-3040, or FAX 314 731-4210. Rooms rates are $58 for single or double or $68 will get you a "suite" for single or double. The hotel has a coffee shop and nice restaurant, with another restaurant/bar next to it (in same parking lot). It is approximately 4 miles west of St Louis Lambert Airport with shuttle service and approximately 10 miles book your room prior to Feb 4th, 1994.

Schedule of Events

Friday Afternoon, March 3rd
Registration
Hospitality Suite
Informal Dinner
Special Interest Group Meetings
DSP Symposium, conducted by Jon Bloom, KE3Z

Saturday, March 4th
Registration
Presentations
Lunch
Presentations / Symposium
Dinner
Special Interest Group Meetings

Sunday, March 5th
Special Error Correction Techniques Workshop
conducted by Phil Karn, KA9Q
Special DSP-93 Workshop
conducted by Bob Stricklin, N5BRG

Detailed conference information and schedule will be mailed to all
pre-registered participants.

Annual Meeting Registration Costs

(without dinner) (with dinner)
Pre-Registration (before Feb 17th) $15.00 * $25.00 **
Late Registration or at door $20.00 * $30.00 **

* Annual Meeting Registration includes:
A copy of the TAPR 1995 Proceedings
Dinner Friday Night (pizza out)
Lunch is not included this year.
The College provides food facilities.

** TAPR Dinner Saturday evening (limited space),
Prize Drawing, Speaker (TBD)

DSP Developers Symposium, Friday

3pm. Conducted by Jon Bloom, KE3Z

Pre-Registration (before Feb 17th) $10.00
Late Registration or at door $15.00

Error Correction Techniques, Half-Day Workshop, Sunday

8:30am - 11:30am. Phil Karn, KA9Q

Pre-Registration (before Feb 17th) $10.00
Late Registration or at door $15.00

TAPR/AMSAT DSP-93, Half-Day Workshop, Sunday

12noon - 3:00pm. Bob Stricklin, N5BRG

Pre-Registration (before Feb 17th) $10.00
Late Registration or at door $15.00

I was looking at a catalog with a CTCSS encoder/decoder. I see
a (maybe) 28 or 40 pin DIP on the board and a few passive parts -
that's all.
1) Who makes a CTCSS chip?
2) What's the part number?

The Jan 95 AmSoft CD-ROM will be shipping December 23, 1994.
Cost is $39 plus shipping $3 USA, $5 Foreign. Over 20,000
files for amateur radio. Plus the CALLSIGN call book, and
AMCALL the new logbook from AmSoft that will auto log from
the CD for you. Over 1,350 Radio Mods. The latest HST images.
Over 700 Megabytes of Amateur Radio Software packed into 1 CD.

Version 4.0 Callsign will search for US & Foreign amateurs by
CALL or partial CALL
LAST NAME, FIRST NAME, or partial NAME
STATE, CITY or partial CITY
ZIP CODE or partial ZIP CODE
Create Avery label mailing lists
Create QSL address labels
When used with AmCall Logbook, will create your QSl contact information labels.

Help locate lost & missing children too. The complete list of
1,100 .gif images from the Heidi Search Center is constantly
maintained with up to the minute changes shown on the WWW at
http://www.halcyon.com./alt.missing-kids.gifs

This CD is published every 4 months without delay every JANUARY, MAY, & SEPTEMBER.

If you would like to know what others think about the AmSoft CD-ROM then read what

4881. JNOS1.10g...AX25 Forwarding

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-21 23:40:42 UTC
From: MKFR00C@prodigy.com
Message-ID: <3daedq$47ve@usenetp1.news.prodigy.com>
Source record: 45712

I have JNOS1.10g running on a 386 computer in a remote location. I would like to set it up so that it will be able to recive and forwarded AX25 messages form a PBBS. Also I would like to have it setup where it would work like a regular PBBS and at the same time still have the TCP/IP features work. Is this possible and what files to I have to change to make it possible.

73,
Jon N2XFZ

From: erik@ve7mdl.ampr.ORG
Message-ID: <15974@ve7mdl.ampr.org>
Source record: 45719

Don,

I have both the "old" AEA Fax and the new AEA Fax 3. The hardware appears to be the same, but the software is substantially upgraded:

1. They have included a database of Fax stations. You can search on location and scheduled start time. It is not possible to search on callsigns :-(

2. You now have some choices in how you display the fax. It is possible to "false colour" the images. Most of the time I found this to be useless, but the occational time, it greatly enhances an image.

3. The user interface is somewhat enhanced.

4. The manual is MUCH better.

5. The software also allows you to receive RTTY, morse and Navtex/Sitor

The user interface could easily be improved, but overall, this is a much better deal and certainly an inexpensive way to get going on receiving Wefax. It is worth the price.

Note that the initial release of the software had some problems (this was explained to me by the local toy store) and a new release is now out. I still have to pick up mine.

73 de VE7MDL ....Erik.

4883. SSTV Scan Converter Suggestions

I read some time ago on Radio Rivista (the official magazine of Italian Amateur) that a 19200 modem was developed using various block of G3RUH modem.
No difference in radio-modem interface were found, but the modem was completely differente.
E-mail me if you are interested in such realization.

Yes, see 97.305, both baudrates and occupied bandwidths are limited.

>It seems to me that packet radio is about 5 years behind the modem
>industry.

There's more to it than that. Telco modems achieve their high throughputs
by use of training sequences over their point to point duplex paths, which
have fixed characteristics for the duration of the connection. The connection
is established out of band by the telco network, and connection signalling is
done out of band, IE by the ring signal or busy signal. Once a connection is
made, it is neither shared nor interrupted until the conversation is complete.

Amateurs, on the other hand, operate simplex half duplex on shared channels,
often with fading and multipath. Packet identification is done in band in
the headers of each packet. That means training can't be done, and modulations
have to be decoded by every station on the network on a packet by packet basis
in order to determine if the packet is addressed to that station or not.

If amateurs wish to nail up a duplex fixed RF path between two stations,
they too can use telco style modems and achieve telco style throughputs
on voice bandwidth channels. But most of amateur operation is not this
way, so different, and somewhat less efficient, methods have to be used
that are adapted to the realities of operation on shared simplex channels.

There are, however, higher speed modems in use on amateur radio. The
GRAPES 56 kb RF modem is an example. It achieves a 56 kb rate via MSK,
without training or compression, but occupies 1.2 Hz per baud to do so,
and thus won't operate through voice equipment or over voice bandwidth
channels.

We decided that the best *switch* for mountaintop use in our network is the lowly PC, with an Ottawa PI card or cards on board. PCs are cheap, and replacement components are available everywhere on demand. They have proven to be reliable in the mountaintop environment. And because they have enough memory and processor horsepower, are able to run more advanced networking software for our 56 kb networks. The only TNC that came close to meeting our needs was the Kantronics Data Engine, but because it's single sourced, and more expensive than a PC clone assembled from parts, we opted to use the PC. We started with simple 8088 systems, but as prices have fallen, use of 80386SX systems has become standard for us. No keyboard or monitor need be left at the site. Those can be brought along when troubleshooting or on site updating are required. Normally, we do system maintenance and software upgrades over the network.

We use a locally modified version of Karn's NOS as our switch software, but now that we've upgraded to 386s, we may switch to Linux with native drivers.

Help !!!
My local police dept. has gone to an 800 MHz trunked system. That in itself is not a problem but what is, is the fact that they now have the capability to TX in a digitally encrypted mode. I'm pretty sure it is digital because when monitoring a freq. that is being encrypted all I hear is white noise (sounds like static) The question I have is does anyone out there know of software that will run on my 486 dx33 machine that will allow me to interface to my AR3000A to follow trunked channels (just to cut out the local bus service and future public utilities radios that will all soon be using the same freqs. and all I want is the police). Either that or software to decode the encrypted voice transmissions. One more thing, a friend of mine showed me a demo of a program from somewhere in Canada that could interface to my radio and follow cellular phone calls does anyone know any more about this software and if it is modifiable to follow individual radios in a trunked radio system. It might be some sort of test\diagnostic program. Does anyone else out there have a similar problem, if you do I would like to know how you are dealing with it. Any and all help would be greatly appreciated. Thanks a lot in advance for all replies concerning this matter. Happy Holidays and thanks again.

Well, probably, but there are some valid reasons and others not so valid.

The FCC does limit bandwidth. Packet is (with a few exceptions) a
half duplex operation. Rather than operating as a dedicated channel between
two stations, it is usually configured as a shared channel so when the
channel gets busy, collisions become a problem. What is really bad
about packet is that the effective baud rate on a busy channel is
sometimes less than 10% of the rated speed.

There are other reasons, 9600 baud and up requires either mods to existing
radios, or special radios. Not as easy as just plugging into the mic jack
and speaker like you can at 1200 and 2400. I'm sure others will
comment as they have in the past.

73, Jim.

>

I have both of these on my anonymous ftp server - physc1.byu.edu in directory hamradio. arespk30 is still the current version (the developers live in this area and they basically haven't touched it in years). I believe that aresdata is version 1.6. My source was KD7UM in Salt Lake who claims that it is the "definitive version" but I'm not positive on that.

It is possible to soup up an RUH to run at 64kbit/s. There was such a
link running in the UK not too far from me, although I think it has gone
now because one of the amateurs concerned moved QTH.

RE:

>Barry, this is not right! Beware. You are taking a Part 15 device
>and adding a power amp will remove the type acceptance. It will no
>longer be under the part 15 rules and regulations. Now, you can add
>an antenna, but only to certain devices made during a specified time
>period. Look at the Part 15 rules and regs.

Part 15 is irrelavent. Since you (as an amateur) have privleges in
the 900 mhz band I would assume modifying a Part 15 device (therefore
making it un-type accepted) for Amateur use is no different than
modifying a Video Rabbit for 900 ATV (using an amp). Legal, as long
as it used under Part 97 regulations. Works great for my remote robot
video link (drifts a little though). Yes, I ID my robot video link
according to the FCC rules.

If modifying type accepted equipment for ham use is wrong then I guess
modifying CB's for 10 meters, commercial VHF/UHF radios for repeaters,
and microwave ovens for ATV, etc. is all illegal. Stuff hams NEVER do...

As for adding an antenna, many SS modems used today can and are used
with an external antenna (yagi usually) for point to point service.
In fact the ad I saw today in a Data comm rag spec'ed "up to 6 miles
in LOS PtoP service". That's using 1 watt into a 9 or so element yagi.
Hell, with that range it would't even need a power amp for many ap-
plications as long as one had a good site and decent antennas on both
ends.

>The other sticky point is that amateurs are only allowed 3 spreading
>sequences. Chances are good that these surplus modems do not use
>one of these codes. Thus if your idea is to add an amp and then
>operate under part 97, you'll still be missing the mark.

Agreed, the spreading sequence should be one of the ones allowed by
the FCC for amateur use. However, since these devices were originally
type accepted under Part 15 service, it is a known spreading sequence
and getting FCC approval for amateur use should be relatively easy.
(Note I said should...)

I assume the main goal of the FCC defining the types of spread spectrum
sequences for amateur use was so they could monitor them (no secret codes,
languages, etc. allowed). Not an issue here. 900 Mhz SS modems are a common
item and using I assume the FCC already has methods of monitoring / decoding
them.

>See how easy all of this is. Read your rules and regs. If you feel
>that they are too restrictive (which they are) then comment to your

>ARRL Section Manager and tell him that the rules need to be changed.

I'd want the changes to occur fast. Factoring in the ARRL would probably add a couple years to the approval. They'd need to set up multiple studies, spend lots of ARRL members money and then they'd table it since it lacks tubes and doesn't use morse code. Remember all the crap we went through to get ASCII approved for ham use? If the FCC was really serious about amateur radio as a way of developing new technologies they need to minimize the rules and/or have a much faster process of amending the rules.

With the new Congress wanting to deregulate and get the government out of peoples lives what a better place to start?

The End:

I attempted to make two points in my post about WWW over 9600 baud packet. One, is that 9600 baud packet is not really 9600 baud in the real world. The other point of my post was that there are other ways of getting data back and forth than AX.25 over RF. We need to start looking towards better and faster methods for amateur data communications.

How about setting up ISDN speed (64-128K) for local links, faster ATM (25+ mb/s) based RF links for backbones (or eventually local links)? Frame relay is another technology that we could leverage on.

With such a backbones we could use MPEG for video and audio for video/audio nets (everyone sees everyone else - at the same time), WWW pages, TCP/IP based services, repeater links, client/server types of applications (databases, shared file systems, multimedia, etc.), the frontier is endless.

We need to be on the bleeding edge of technology, not waiting for it to come to us. With the exception of the Microsats, Phase IV and some of the original AX.25 efforts I really don't see amateur radio being much of a pioneering force any more.

It's hard to get a kid excited about 1200 baud packet when she can sit at home and net surf at 14.4kps and beyond. Or be impressed with the capability to communicate via a handheld across town when he talks to Mom anywhere in the world via cellular.

Folks it's time that Amateur Radio started making some WAVES again. (pun intended). Support AMSAT, TAPR, join your local ham club, start a high tech net, get your fellow techies at work to get a license, design, experiment, above all don't settle for the status quo.

Hams, LETS INNOVATE...

Let the flames begin...

>tell you that.

9600 baud requires a true FM radio, not PM as many voice rigs are.
It usually requires a crystal controlled radio rather than a synthesized
one since the PLL loop can cancel some of the lower frequency components
of the modulation (response down to 10 Hz required, DC response a plus).
It requires a receiver with an IF filter and discriminator with a linear
frequency and phase response of +/- 13 kHz of channel center, which few
voice radios can meet. It requires a radio with direct VCO modulator access
and direct discriminator access, which usually requires internal surgery
to voice radios. And fast Tx/Rx switching is a nice bonus if you can get it,
though it isn't a strict requirement. Many radios can be modified to do 9600
baud, but the modifications are often extensive.

>56K is available, but cost prohibitive. Nobody's there if you do speak 56K,
>either, so it's hard go get the ball rolling.

I don't call $250 for a GRAPES RF modem prohibitive. It *is* the radio
after all. You do need a transverter to kick it to UHF, but Down East
now has one that will do it for $155. That's still less than the HT
that many hams want to use for packet. I do agree that it's hard to
get the ball rolling. Doing a group buy is the only reasonable way to
get 56 kb going in your area.

Gary

Can you refer us to a non-Compu$erv source? I don't have a Compu$erv
account, and I'm not going to get one either. Is this available
elsewhere by ftp, www, gopher, etc.?

I'm thinking about getting into packet, and using a Yaesu FT2700RH. I'm
willing to perform any modifications required to the radio, or even to
determine what modifications are necessary and then post them for
others. What specs are required from the radio?

>range on a bad day or when someone runs a high txdelay.

Pardon any ignorance on my part, but ...

The latency of a delay before sending data over a transmitter, to wait for stabilization etc., will be made negligible if the packet lengths are increased to a large enough value. As bit rate increases, packet length ought to also increase so as not to be swamped by the startup latencies.

The bit error rates for a given transmission channel are roughly constant. This means that as packet length increases linearly, the probability of an error in the packet increases exponentially. Forward error correcting protocols can be used to offset these effects--effectively lowering the apparent bit error rate for the channel. However, the principle of exponentially increasing probability of packet error requiring retransmission as packet length increases linearly still remains.

Therefore, for any given [channel / error-correcting-protocol / bit-rate / bit-error-rate / latency] combination, there is an optimum packet length. Perhaps the packet length being used at 9600 bps is too small?

>tncs, and a couple of PacCom Tiny-2 TNCs. I prefer the PacComm TNC and
>it's about the same price as the MFJ tnc.

Pardon any ignorance on my part, but ...

I am thinking of getting into packet radio. I also have some very definite biases, and would like folks here to respond--both to my biases and to my questions.

Hardware is hardware and software is software. The only interface between hardware and software should be through device drivers. Thus, new software can be written for old hardware, and new hardware can be used with existing software by simply writing new device drivers. For this reason, I am against the idea of a TNC. I would much rather buy a simplex modem to connect to the radio, and write (or obtain) device drivers and software to use that hardware. This software can provide ax.25, tcp/ip, tnc functions, bbs functions, networking functions, or whatever else is desired.

I refuse to use any OS other than Unix. I run Linux on IBM PC hardware. I will not use DOS under any circumstances. I will not even have any DOS partitions on my disks. Therefore, if unix based software is not available, I will either write my own, or avoid packet radio.

What simplex modems for packet radio use are available?

What software is available?

Where are the required specs for packet transmitters and receivers, such as bandwidth and maximum allowed settling time for VCOs?

It appears to me that a very simple solution to increase the bandwidth of local vhf/uhf packet networks is to use more channels. Similar to trunked radio systems, where a controller tells both radios which frequency to use, and traffic nets where the net control operator sends stations off the net frequency to pass traffic, two or more packet stations could be automatically sent to another frequency to transfer files, if they could control their transmitter and receiver frequencies. Is this being done? If not, why not?

No radio is going to provide DC response. OK--if you were to encode
analog signal levels and send them by an encoding of a digital signal,
and then at the receiver send that recovered digital signal to an A/D
converter, you could get DC response out of a radio link--but this is
not true DC response. It is not possible to provide DC response on a
radio link of any type.

I can understand why a PLL is undesirable if low frequency response is
required, but why is true FM required instead of phase modulation?

Hi Folks !!

I'm trying to get rid of RF emissions from my PC, and need to find a source of plug-on EMI filters (9 pin and 25 pin) for the serial and parallel ports....does anyone know WHERE in Canada or the U.S. I can buy these goodies ??

I checked with one source here in Vancouver....but the pricing was absolutely ridiculous - $25 to $40 U.S. ** EACH ** (!!!!) with a 10 piece minimum order....surely these things are available in small quantities at a more reasonable price.....

Oh, yes, I am interested in supressing radiations near the 2M ham band......

Thanks in advance for any ideas !!

Victor -

Go for a KPC-3. It's the most versatile, easy to use, full featured TNC
for 1200 Baud packet around. In fact, why not round up a copy of QST
DEC 1993, page 80 and see their comparison of these low end TNCs. Keep
in mind there may have been some ROM updates since then, but it will
offer a good comparison. I own 2 KPC-3s, one for home use, and one for
portable packet operations with a HP-95 palmtop...one year later I feel
I made a great decision.

First off, ignore my last post of resending your message, goofed up
my follow-up. I'm entitled to a mistake a year, I'll use mine now :-)

After beating on 9600 for a while I found a few things about packet
sizes and txdelay. First the biggest factor in running from the
mid 400 cps range to going up into the 600-650 cps range was a simple
switch from 9600 to 19200 on the serial port. Another way to increase
it is to run larger packets. I'm running a tcp mss 1024 and tcp
window 2048 now and thruput is faster on ftp's.

The above tests though are with your 'not-so-normal' everyday packet
use. That was by doing a lot of ftp's of various sizes of files. In
normal use though the single biggest factor in response time over packet
was always the txdelay. Someone running 300 ms seems pretty sluggish
at 9600, but 80 or 100 ms seems a lot faster. It's the smaller packets
that are sent in normal everyday use such a wandering around a BBS,
sitting on a DX cluster, keyboard-to-keyboard. When you go up into
higher speeds your txdelay may become longer than the transmission
of actual data, and this is what makes it start appearing sluggish.
On a relatively continuous transmission over a period of time, like
an ftp, varying the txdelay from 100-300 ms doesn't seem to make a
whole lot of difference though, it's the packet size that does it
there.

I got pretty strict on txdelay around here. I had a lot of people say
"my radio can't use a fast txdelay". These are folks running modern
radios too. I finally sat down on a busy freq with some friends and
I found that when I ran 150 ms at 1200 baud even an Icom O2 HT running
closed squelch will decode every packet with no problems. Most radios
I ran across worked fine at 150 ms, even HT's did. Of course our
tnc's were all calibrated correctly too and we weren't runing high
audio levels or deviation eithers. The brand of radios though that
did have the biggest problems were always the Alinco radios. If someone
starts to miss packets from me my first question is always "Are you
running an Alinco?", and they almost always are. Open squelch doesn't
help either, it's the radio. My Kenwood TM-731A dual-band is the
fastest mobile rig I found. I can transmit with 80 ms and receive
at 50 ms txdelay. I now run 150 ms at home and 200 ms on a switch

site for 1200 and 100 ms for 9600 and I wont' go higher either, but I will go lower with them.

: some problems running WNOS in the past, and wanted to find something
: that would accomplish the same things while allowing me to do other things
: one the same computer.)
I don't now about a WNOS port to Linux. There is a JNOS port for Linux,
which runs fine. You can also use the builtin AX.25. But before you use
Linux, see if you can find a Linux-user who can help you. Linux is a
Unix-Clone and much more complicated than DOS or OS/2. But it is real
multitasking and 32-bit and more stable than other operating systems.
If you are interested in computers, than Linux is the best Plattform for
Packet Radio.

I'm a little over my head, but my understanding is that it's more than bandwidth, it's the shape of the passband that often counts. 9600 requires (as I understand it) only 12kHz, (2 meter FM is limited to 16khz, so that isn't a problem, btw). However 9600 is FSK not AFSK, so phase distortion becomes very important. Also, it seems like the best way to go for 9600 is with simple xtal radios. Easier to modulate/demodulate; you can get Motorola Moxies for under $50 and I'm told that they are an excellent radio for 9600.

(don't know first-hand, though - I'm still trying to get some!)

Amateur Radio Equipment verses FCC rules:

All commerically manufactured equipment where the receiver operates over 30 MHz must pass Part 15 rules. The transmitter only must pass Part 97 rules. And is never tested at the F.C.C. testing site.
Amateur amplifiers that operate below 30 MHz must be type accepted,

AmateurTransmitters and receivers that operate below 30 MHz only are required to operate under Part 97 rules, actually the FCC does not care about the H.F. equipment except for the amplifiers, a manufacturer never has to present a H.F. radio for testing, or paperwork about the product, unless there is some sort of problem big spurs etc. Now an Amateur manufacturer dare not advertise the unit is able to operate on frequencies outside of the Amateur bands though. That is what got Kenwood into trouble with the TS-50 a year or so back they published the transmitter would cover 27.500 MHz, all that was changed was the brochure. The F.C.C. does not really care where the H.F.

radai is able to transmit, just DO NOT advertise or show INTENT that it can transmit outside the Amateur Bands as a manufacturer will get pinched on the intention of selling the unit for use in another service where type acceptance is required. In the commerical marine and land mobile radio world, a manufacturer can not even post a price on a new piece of equipment until it has been type accepted. The F.C.C. does make it to the trade shows and will cite you if this is done. It all gets pretty interesting just how rules affect the radio equipment. I use to work for Icom and learned all of this there.

For Homebrew equipment, all the Amateur Radio operator needs to be concerned with is Part 97, and your are correct that most likely Part 15 would not matter here, unless he tried to return it to the original service it was designed for.

I think we have to distinguish between mdem for usual ham rigs (25KHz BW of RF
channel) and modem developed for dedicate RTX such as the YT3MV's 38400 bit/s
Manchester modem/ 23cm RTX.
G3RUH modem can be operate at higher speed but the necessary BW will be
consequentely higher.
Hope this help

: 88 includes software and a power adapter. Does any body out there have
: any opinions? Tnx, 73
: -
: VICTOR MORANGE, DDDP59B@prodigy.com, tmorange@delphi.com, KE6MWA

If you have a desktop computer, the PCB-88 is a nice machine but would require some juggling of the IRQs if you have a lot of add-ons. I have a PK-88 and it is a nice TNC. I also have a KPC-3 and KPC-9612 and these are good for portable use as they run from a 9-volt battery. I would go with PK-88 for a first TNC as it is pretty good in the command set dept and is easily changed from KISS to normal modes if you happen to run a NOS program. They are all pretty good for a first TNC.

Good luck, Merry Christmas and 73.

4926. Re: Why so slow?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-23 16:56:21 UTC
From: john.ackermann@daytonOH.ncr.com
Message-ID: <john.ackermann.282.000BF0D0@daytonOH.ncr.com>
Source record: 45745

In article <1994Dec23.010231.19135@seas.smu.edu>, kjh@seas.smu.edu says...

>No radio is going to provide DC response. OK--if you were to encode >analog signal levels and send them by an encoding of a digital signal, >and then at the receiver send that recovered digital signal to an A/D >converter, you could get DC response out of a radio link--but this is >not true DC response. It is not possible to provide DC response on a >radio link of any type.

I don't know how technically-precise you intend that statement to be, but in practice DC is just very, very low frequency AC, and you <can> reproduce a DC level through an analog radio link.

As used here, DC response means that there's no capacitive coupling in either the modulator or demodulator. A DC coupled radio <can> reproduce a DC signal; it's represented by a shift in carrier frequency to a new steady state, rather than a varying shift.

For example, the Kantronics D4-10 data radio is DC coupled, and you can put a DC signal into the modulator and walk the carrier frequency +/- 10kHz from center with it. A receiver with DC coupling would develop a steady DC output voltage based on that input.

This is valuable in data applications, because a long string of the same bit looks like DC. Sending this through a radio without DC coupling will result in a "wander" of the discriminator's output as the capacitors in the mod and demod circuits charge/discharge due to the steady-state of the modulation.

|>
|> >See how easy all of this is. Read your rules and regs. If you feel
|> >that they are too restrictive (which they are) then comment to your
|> >ARRL Section Manager and tell him that the rules need to be changed.

First point. Don't bother talking to a Section Manager. Talk to your ARRL DIRECTOR. He is the guy who can affect ARRL policy changes. The SM's are only responsible for the local section operations. They don't have any major input in to ARRL policy.

|>
|> I'd want the changes to occur fast. Factoring in the ARRL would probably
|> add a couple years to the approval. They'd need to set up multiple studies,
|> spend lots of ARRL members money and then they'd table it since it lacks
|> tubes and doesn't use morse code. Remember all the crap we went through to
|> get ASCII approved for ham use? If the FCC was really serious about amateur
|> radio as a way of developing new technologies they need to minimize the
|> rules and/or have a much faster process of amending the rules.

Second point, and the main reason for the post. I guess Barry is going to be a little put out by this. ARRL has already taken on this fight as of the

Jan 94 board meeting. Their legal council was directed to seek an NPRM
to loosen up the rules you are talking about. I'm not sure whether Chris
has had a chance to submit the request yet, but he has had a pretty busy
year this year what with things like the 2400 Mhz band grab, et al, occuring.

And from my observations of how this occured, it was really do to just a couple
members pointing out the problems to both FCC and the ARRL BOD members that
caused ARRL to move, and actually, within a couple months. (So there
goes your complaints about ARRL being slow (just this once) ;-)

There are some historical things you are also ignoring that caused the
current situation. For the hams to even GET Spread Spectrum allowances the
first time, it took approval of more than just the FCC. The NSA, amongst
others, had to approve. I'm not certain that this situation will occur
this time around, especially with the plethora of part 15 SS devices
running around today. NSA, et al, just won't have that much to complain
about since the cow is already out of the barn.

Read the ARRL Spread Spectrum source book for a good history of how
we got our current rules, and why they are so restrictive!

From: hanko@wv.mentorg.com
Message-ID: <3df5o9$8dm@hpbab.wv.mentorg.COM>
Source record: 45746

Check out the Kantronics KPC-9612.

This is a two port TNC, does 1200 and 9600 at the same time
on two radio channels.

In my opinion, it is the best price/feature tnc available
at this time, and is a cheaper solution for 9600 even if
you don't use the 1200 baud port - which can be used at the
same time the 9600 baud port is in use.

I have one on my system at home, and am quite pleased with it.

(I also have an MFJ, a TAPR TNC1, a Tasco, an AEA PK-232,
HAL PCI-4000, KAM, KPC-3, probably missed a couple.
They seem to breed once you acquire more than one ...)

: >rates like 9600 and (*ghod*) 1200 BPS? Is there an FCC limitation on
: >bandwidth or something that I don't know about? (Probably)

: Yes, see 97.305, both baudrates and occupied bandwidths are limited.

As Gary says, "there is more to it than that."

People want to run data through existing voice radio's
microphone and speaker connections. This is a much bigger
limitation than legal limitations at the most popular
frequencies used. Typically, voice radios have extremely
large amounts of phase distortion, resulting from the filters
that allow closely spaced channels. This is why people use
1200 bps.

: Amateurs, on the other hand, operate simplex half duplex on shared channels,
: often with fading and multipath. Packet identification is done in band in
: the headers of each packet. That means training can't be done, and modulations
: have to be decoded by every station on the network on a packet by packet basis
: in order to determine if the packet is addressed to that station or not.

This is done for economics. People like Gary use transverters
marketed for other purposes (primarily making long distance SSB/CW
contacts). You could use a pair of transverters on separate bands
to obtain a full duplex link, but this doubles the RF hardware cost.

I might add that people underestimate the difficulty of linking
computers with RF links. An analogy might be looking at distant
stars at daytime versus night. It can be done, but the noise
from the Sun complicates the task considerably. For the most
part, the RF designer does not get to turn off the noise sources.

>not true DC response. It is not possible to provide DC response on a
>radio link of any type.

Ah, perhaps it was clumsy wording on my part. With a discriminator based demodulator, it is possible to get zero volts out for a signal that is exactly on center frequency, and correspondingly larger + or - voltages as the carrier swings to one side or the other. With other forms of demodulator, such as a ratio detector, this "DC response" isn't possible. Also, any capacitor coupled stages between the demodulator and the modem will also remove the "DC response". With a radio like the Kantronics D4-10, it's possible to transmit baseband data via direct FSK because a slicer can take the "DC" levels coming out of the demodulator and convert them back to baseband data. In fact, that's how the D4-10 works at 19.2 kb. A G3RUH waveform also needs this baseband type of response from the radio.

>I can understand why a PLL is undesirable if low frequency response is
>required, but why is true FM required instead of phase modulation?

A phase modulator can't reproduce the "DC response" of an FM modulator. The PM only responds to the derivative of the modulating waveform. A steeper slope results in a larger shift. Without a changing slope, the output center voltage is undefined. This automatically gives a 6 db per octave pre-emphasis above DC, and no reproducible DC response at all. This pre-emphasis puts a bias in the signal that's undesirable for a data modulation. In practice, response near zero Hertz is either absent or grossly distored with a PM modulator.

The reason that all this is important is that clock recovery depends on precisely locating zero crossings in the signal. A PM mod/demod introduces an uncertainty to the precise location of the zero crossing. That in turn results in clock jitter.

Gary

I have used AEA's FAX III. Yes it does add color. In version 2 they also
added the ability to copy CW and RTTY.

The color is not sent by FAX. The user defines a folor for each level of
gray scale.

Maps are not better since the service sending them has not changed. The
same is true for the color of the FAXs send. They are all black and white.
All color programs have the color added after the user has received the picture.

I saw in a different message that you wanted AEA's Internet address. It is
76702.1013@compuserve.com

They are active each day of the working week.

Bill

Can anyone make some suggestions about tweaking the TNC? Watching the screen on the machine running JNOS 110h I can see that lots of packets get repeated, apparently because the distant station (not very distant, at that!) hasn't got confirmation from the last packet. I know there's some danger here; if I started messing with the 802.3 packet timing I'd be a most unpopular guy on my company net.

Thanks, and happy holidays.

I agree with Dan, N4WZR. The KPC-3 is a superior TNC to the "starter" TNC's. It's very easy to use, goes for a moderate price, and works very well with most shareware packet programs. (Namely paKet 6.1...a very good program that can be had on your local ham BBS.) 73's

|> 9600 baud requires a true FM radio, not PM as many voice rigs are.

Only because NRZI-encoded data is used. If some clever coding for baseband spectrum shaping were used, PM rigs would be entirely suitable for high speed data. (Of course you'd still want to remove all of the phase-distorting audio filtering).

Manchester coding is one example of baseband spectrum shaping, but there are better schemes that don't require quite as much overhead.

The Compact Disc had a similar problem with a similar solution. The servo mechanisms that keep the optical pickup on track are sensitive to low-frequency components (< 20 Khz) in the data stream. So the data stream is encoded using Eight-to-Fourteen (EFM) modulation. A lookup table converts each group of 8 user data bits into 14 channel bits plus three padding bits chosen such that the pits on the disk are always at least 3 channel bits long but never more than 11.

The result is a channel signal with no low frequency components to screw up the tracking servos, and no frequencies beyond the resolution of the laser pickup's operating wavelength.

This particular scheme was designed specifically for the CD and I'm not advocating that we use it as is. But it does show the general idea. If we had good figures for a variety of existing radios I'm sure we could apply the same idea to the design of a channel code that would work well with them.

Phil

4941. Modify Yaesu FT736R for 9600 packet?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-24 13:54:43 UTC
From: dssn@uhura.cc.rochester.edu
Message-ID: <1994Dec24.135443.29437@galileo.cc.rochester.edu>
Source record: 45779

Greetings,
I am assembling a satellite packet system for use in Ghana,
West Africa. I have a Yaesu FT736R and a KPC9612 TNC/modem. Where
must I take my input/output leads to connect my radio to my TNC? There
is a data plug on the Yaesu. Can this be used? From what I have
heard, I must open the Yaesu, solder wires to two different points
(what are these), and then feed these to the TNC. Is this information
correct? If anyone can give an idiot directions, please respond by
e-mail. Thanks in advance.

4942. X1Jr2 Ping problem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-24 13:57:48 UTC
From: rapp@lmr.mv.com
Message-ID: <D1BJ18.2Aq@mv.mv.com>
Source record: 45782

I am having a problem pinging an X1J revision 2 node (with the buffers patch). I (and others) can ping a similar node burned from the same software. The only difference (other than callsign, etc.) is that the node that we can't ping is an MFJ 1270. I believe we modified it for use with X1J, but we might not have done the wink 'n' blink mod if that matters.

Any suggestions? Thanks, and have a merry Christmas!

Yes, there is ham radio in Saudi Arabia. The callsigns all begin with
"HZ". Your best bet would be to get in touch with some local hams.
There are some in Riyadh. Good luck!

>whatever else is desired.

Hardware acceleration is generally either, a) very desirable, or b) necessary for packet operation on PC class machines. This is one reason a TNC may be desirable. It does the HDLC conversion in hardware, does channel management and data buffering via it's on board microprocessor, and speaks the KISS protocol to the PC serial port. On the PC, you then run higher protocol programs which speak KISS on the serial port via a device driver, or directly by a driver module in the program, and do AX25, TCP/IP, BBS, etc functions on the PC side. Almost all TNCs will handle 9600 baud (with an external modem), and a couple will successfully deal with 19.2 kb.

There is another option, and that's a plugin card for the PC that does the hardware HDLC and direct DMA to/from memory of the packet data. This avoids the async bottleneck in the PC architecture. Two such cards are the Ottawa PI card and the Gracillis PacketTwin card. They communicate with the PC program via a device driver or direct program interface. This is the way to go for higher speed packet, such as with the GRAPES 56 kb RF modem.

At the very lowest packet speeds (300, 1200) software bit banging
can be done using a simple modem (Baycom, etc). However, this is
a very poor solution if you want to run multiple ports, or any
speed faster than 1200 baud. The PC's processor has to dedicate
substantial realtime capacity to doing this bit banging, and
while it works under DOS at up to 1200 baud, it's very unlikely
to work with a multitasking OS like Linux.

>I refuse to use any OS other than Unix. I run Linux on IBM PC
>hardware. I will not use DOS under any circumstances. I will not even
>have any DOS partitions on my disks. Therefore, if unix based software
>is not available, I will either write my own, or avoid packet radio.

Ah, well you are in luck. There is a device driver available for the
Ottawa PI card under Linux, and an AX25 module that interfaces with
the native TCP/IP in the OS. Or, there is a version of JNOS for Linux
that will duplicate the functionality of the DOS KA9Q NOS program.
That program offers its own version of TCP/IP optimized for packet
radio, and includes AX25 connect capabilities and a BBS as well as
the ability to interoperate with the NetRom network.

>What simplex modems for packet radio use are available?

TNCs have built in modems for 300 and 1200 baud. Kantronics
offers one that has 1200 and 9600 baud modems, PacComm does
too. However, for most higher speed access, external modems
are used for the TNC, or for an internal HDLC card. These
include the G3RUH modem for 9600 baud, and the GRAPES 56 kb RF
modem. If you want a standalone 300 or 1200 baud modem, you'll
have to build it yourself, or buy the daughter card for the
Gracillis board. Note: the GRAPES 56 kb RF modem is capable of
full duplex operation, and *is* the radio as well as the modem.
You add a transverter from 29 MHz to the band of choice.

>What software is available?

Well, with a TNC, you can use its user firmware and any
async communications program, even cu, though Procomm is
a favorite in the DOS world. Or you can use a TNC speaking
the KISS protocol with a number of packet programs, including
all the versions of KA9Q NOS. For Linux, you can use the
AX25 driver and the native TCP/IP, or you can use JNOS for
Linux.

>Where are the required specs for packet transmitters and receivers,
>such as bandwidth and maximum allowed settling time for VCOs?

Part 97.305 and 97.307. There is no specified settling time, everyone
is trying to make it as quick as possible. Something below 80 ms is a
good target for the slower speeds. Something below 5 ms is good for
56 kb.

>It appears to me that a very simple solution to increase the bandwidth
>of local vhf/uhf packet networks is to use more channels. Similar to

>trunked radio systems, where a controller tells both radios which
>frequency to use, and traffic nets where the net control operator sends
>stations off the net frequency to pass traffic, two or more packet
>stations could be automatically sent to another frequency to transfer
>files, if they could control their transmitter and receiver
>frequencies. Is this being done? If not, why not?

No, we don't do it exactly that way. We break our user communities
up into LANs (actually MAN would be a better term, but LAN has become
the accepted usage). These LANs are interconnected by high speed
backbone trunks via the switches in each LAN. This keeps loading on
any given frequency reasonable while still allowing automatic routing
to any station at any time. The problem with the trunking scheme you
propose is that packet typically is multiconnect rather than just
pairs of stations exclusively swapping data. Several stations may
be connected to several other stations at the same time, doing different
transfers. It's important that stations remain on a fixed frequency
where they can be easily found, otherwise the routing tables become
very complex, volatile, and difficult to maintain.

> KC5FFK

Forget about trying to reuse the UDS modem for radio use. Its much much much
easier to start from scratch. The following were found at ftp.cdrom.com
and are probably also at oak.oakland.edu.

In the directory /.14/hamradio/mac/digital, start with this:
-r--r--r-- 1 root wheel 127375 Mar 17 1994 Pkt-Macs-188.sea.hqx

I think this is an older version of the same:
-r--r--r-- 1 root wheel 203551 Jun 29 1993 PMM.cpt.hqx

You will find a Hypercard stack with schematic and instructions on building
a PocketMac Modem for packet radio use on a Macintosh. NET_Mac is the
recommended software to use with this modem, also the SoftKiss driver.
So you would proably want the following too:

-r--r--r-- 1 root wheel 406242 Dec 6 16:12 NET_Mac2.3.46.sea.hqx
-r--r--r-- 1 root wheel 211585 Nov 4 14:27 IM_Mac_1.0b28d.sea.hqx
-r--r--r-- 1 root wheel 1113233 Sep 13 13:50 NET_Mac-environment.hqx
-r--r--r-- 1 root wheel 4145 Oct 28 1993 softkiss.notes
-r--r--r-- 1 root wheel 155580 Oct 28 1993 softkiss.1.8.sit.hqx

Pretty good reading:
-r--r--r-- 1 root wheel 94720 Feb 13 1992 BeginTCP.sit.hqx

A demo of commercial Mac software for KISS TNC's (much easier to use than
NET_Mac, but does not include TCP/IP)
-r--r--r-- 1 root wheel 179399 May 4 1994 Savant_1.0.2_demo.sea.hqx

Other essential things you need include Comapct Pro, UnStuffit, and BBEdit
Lite 3.0. All of these are available at ftp.cdrom.com and any good ftp
site with Macintosh stuff.

Message-ID: <1994Dec24.232357.8076@stdin.gatelink.fr.net>
Source record: 45789

Hello,

Who knows how to modify a PK-232MBX, so that it could run 19k2 Baud on its serial port ? I've been testing some 9k6 FSK uploads with a friend running Graphic Packet + TFPCX + PK-232 in KISS mode. Datas arriving at 9k6 don't go fast enough to the computer, and the controlers just hangs ;-)

I've personnaly been using an internal USCC card (4 modems) from BayCom for a few months and never had such troubles, using the same software configuration.

Thanks in advance for any answer.

: Ken Hendrickson N8DGN/5 kjh@usc.edu kjh@seas.smu.edu

Ken - The basic process is to pick off the received signal right at the FM detector output, ahead of any de-emphasis or other frequency shaping circuitry. The transmit signal must be injected directly at the FM modulator (usually right on the varactor via a blocking cap) A radio that actually uses PM instead of FM won't work at all on transmit. The phase linearity and bandwidth on the receiver bandpass filters is very important - some radios have problems with this though they are fine for analog FM or 1200 baud AFSK/FM packet. Finally, the frequency accuracy is much more important than it is for analog FM or packet - a 1KHz error will seriously degrade performance and a 2KHz error won't work at all. (according to experiments done with my Icom 271E) Note that a 3KHz error on analog FM is just noticable, 1 to 2 KHz frequency errors on 2m are very common.

Good luck! 73 de Glenn wb6w@netcom.com

It is possible to accommodate up to 9600 baud with commercial ham rigs,
providing it is a **true** FM job, not phase mod. Even then to obviate
audio phase distortion it is usually necessary to make internal mods to
both tx and rx. I did my Kenwood TM-702E, but unless you have the
courage to put a soldering iron into an environment of surface-mounted
and miniaturised components, forget it. I had the alternative to
courage (i.e foolishness :-)) to do my rig, and have been using it on
both 144 MHz and 432 MHz tcp/ip for about 18 months now.

The problem of going to a higher baud rate produces bandwidth problems
as the majority of current rigs are filtered with a view to 12.5Khz
spacing, at least in the UK. To go to 19200 baud is really beyond the
reasonable scope of many black boxes because of the constrained
bandwidth available.

Accuracy and stability of frequency is an essential for 9600; some
synthesised rigs are ok, some are not. I think xtal frequency control
is probably a must for getting baud rates up in to 5 figures

Eric,

I have doubled the clock speed in my PK-232. Just install an 8.00 MHz crystal
and up the 2.4 to the approipate value. I am running JNOS and tell it to chat
at 19,200. When you do this all of the values like TX delay, HBaud etc now
need to be set exactly one half of what you desire as the unit is running
twice as fast. So with to operate 1200 baud packet you will now set the unit
to HB 600, for19,200 Tbaud you will set the unit to TB 9600, for a TX delay of
200 Milliseconds you will set TX to 10.
On some processors, this does not work an the Pk-232 merely will not start,
here you may need to get a faster Z80 and 8530, 8536 chips

: talking to a phone. A two to four wire hybrid would be the heart of it.
: 'Offhook' would control PTT. The squelch breaking on the radio would
: generate a 'ring' signal.
: Here is the operational scenario (for use with KA9Q NOS/ Slip link):
....stuff deleted....

Looks like we're on the same track, more or less. I'm kicking around a full-time link of about 20 miles (faster the better of course), PPP under linux. Only real difference I saw was I'm thinking about a hardware timer to hold ptt x seconds. Premise here is that ip activity will tend to come in clusters. IE, user(s) come online, things get busy, link stays up. User(s) go away, things quiet down, ptt switch times out, linux networking daemons rebuild routing tables, arp caches, etc. Actually, there's even a dial-on-demand package floating around lately. Since this is a link, not a public access broadcast I'm fishing for, most other concerns about training time, etc, seem to be trivial.

Anyway, point is, I'm sure from other ip networking experiences that the only missing link is physical marriage of radio to modem. Only thing I've heard from the many nay-sayers that concerns me is the legality of it. Can we legally put a v.34 signal on 440 or higher, without government seizure of our homes?

: base this on the observation that most amateur operation, at least in my area
: (Michigan) at 9600 baud,

Where are you in Michigan? Business takes me there often, but we're getting personal now, so I'll take it to email.

later,
rvz

Hi Greg, that looks about right. ACT (Advanced Compression Technology) make
a suitable speech / data MUX that allows digitised speech at either 7.2 or
9.6 Kbits to be multiplexed with a synchronous data stream and sent over
a composite, synchronous, link. The ACT units handle all the telephone
signalling etc.

We have installed a system in the middle east where the composite link
is a UHF radio link. The only modems you need are the ones shown as "RADIO
MODEM" in your diagram. These have to be sync, and at least 9600bps.

Pete

Hello,

I want to know more information about ham radio. Is there licence
for it in saudi arabia. is it carried every where. or in the computer.
Is there radios for notebooks computer?
Is this radio can be by voice and written messages?
Is your company make radios.
Is the radio send like the normal radio from the air?

At high enough frequencies, you pretty much MUST use AFC, which
means you won't get DC response from the system.

That is why almost all ham digital modems have a scrambler in them, to
enforce a minimum number of bit transitions and maintain a zero. Even
if you don't use a scrambler, the HDLC spec has a zero-stuffing requirement
to ensure a minimum number of transitions (for clock recovery), and if your
equipment is stable enough, the HDLC will probably be enough.
Personally, it seems silly NOT to use the scramblers.

Note that TELCO methods works similarly - B8ZS, AMI, etc, all operate to
ensure sufficient +/- transitions that you can recover clock and maintain
a center.

From: joen9yjz@aol.com
Message-ID: <3dksgq$kec@newsbf02.news.aol.com>
Source record: 45647

Yes, 10 GHz links are definetely a possibility for faster communications...I don't know if there are 10 GHz DATA radios available...but I imagine that with some work, a regular voice radio could do the job. Many TV networks now are using microwave band dishes to do nearly the exact same thing you are speaking of. I believe our local NBC affiliate here uses them to transmit network data feeds. 73's!

Source record: 45659

Hi All,
Yep, I'm about to ask about that horrible thing called WINDOZE!

Unfortunately I have no other choice than to bring up Windows and run FBB under it. I've run into a problem trying to make BPQ work properly with it however.

I load BPQ outside of Windows for efficiency reasons. I have 5 radio ports, one of the ports utilizes a COMM port. Every time I load windows after running BPQCODE, the COMM port that BPQ is talking to is taken away by Windows. I am running BPQKISS in POLLED mode so I can see the very second that Windows takes the COMM port away. Now I can quit windows and it still does not return. I have to totally re-boot the machine to make the COMM port active again. I have tried multiple different changes and can not make it behave, this includes trying other COMM ports.

Now when I load BPQCODE Inside of the WINDOW under WINDOWS with APPEL.BAT it works great UNTIL I switch away from the window. I have BACKGROUND and FOREGROUND set to 100 for attention to the program. When I switch away the Polling drops to nill and my DRSI CARDS have extremely long delayed TXDELAY, and the BBS functions incredibly slow. The very second I switch back to the FOREGROUND the program takes right off. Note, I am NOT running anything else at the time, just switching back to MAIN.

System: 486-66Dx2 with 20Megs memory.

Can anyone help here? Am I simply missing something????

Help!

Dan

4977. QRP-L at NEtcom.com blew up!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-26 16:37:11 UTC
From: samodena@csemail.cropsci.ncsu.edu
Message-ID: <3dmrfn$cg6@taco.cc.ncsu.edu>
Source record: 45658
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.antennas,rec.radio,amateur.homebrew,rec.radio.amateur.digital.misc

Thanks to Tim AB5OU...I've been alerted that we *all* were unsubscribed
from QRP-L at Netcom.com.

I was able to confirm his info (see forwarded message below). I resubscribed
by sending email to: LISTSERV@netcom.com
with no subject
and the msg was: subscribe QRP-L

The only thing it accepts after "subscribe QRP-L" is an address...
but if you put nothing there, it assumes you mean the reply address
on your email. If you put your name there, it will send an error
message back.

You can see how many are on the list by sending an email to:
LISTSERV@netcom.com -- no subject -- put msg: who QRP-L
and the list of current subscribers (about 15) comes back.

SO RESUBSCRIBE YOURSELF NOW! :^)

And send a copy of this message to a couple of others who you know
are on QRP-L...because they will need to resubscribe...

Until N1IST (got only his ansering machine) is able to alert or
restore the original mailing list, this round-robin method may
be the only way to bring most people back quickly.

Hi Dudley,

You can get all the info off the TAPR.ORG listserv.

The basic start is:

TAPR can be reached via the Internet. The Automated Information Server that
TAPR provides allows anyone to request information on TAPR, products,
newsletters, and lots of other files. To find out more about this service,
send an e-mail message to listserv@tapr.org with the subject line "Request"
and the following text in the body of the message:

help (for a brief set of instructions)
index -all (for a list of all file by topic area)
get tapr taprinfo.txt (or info on TAPR)

In the above message example, "help" retrieves a brief set of instructions
for info, "index -all" retrieves a list of available files by topic and
"taprinfo.txt" retrieves a text file containing information on TAPR and what
TAPR is all about. If you want to retrieve several text files with one
message, use a separate line for each "get filename" request.

Basically the cost is $430.

Orders are being taken until Jan 15th now for the March production.

The system has a wide range of software and supports both Mac and
Windows interfaces. The list of modems in the first release is:

Current Software released with first production:
APT demod
CW Filter
9600 baud FSK full-duplex Satellite Modem
HF 300 baud Packet Modem
HF Modem for RTTY, PCTOR, AMTOR
1200 AFSK Packet Modem
1200 PSK Modem
9600 baud FSK half-duplex modem
Windows and Macintosh DSP-93 Interface Programs
which support: Osc, Spec Ana, Function Generator Applications
DOS Loader for those using DOS

Software under test for next release:
400bps satellite telemetry
Audio Filters (which were ready but didn't get in this first run for
some reason)

Updated Modems of the above with new features and improvements
and probably more stuff I can't remember off the top of my head.

Source is distributed with some of the code. There should be enough
source availavble to give examples of all the main modulation techniques
and ways to use the unit.

The document on TAPR.ORG has a description of the design.

Cheers - Greg

: is a data plug on the Yaesu. Can this be used? From what I have
: heard, I must open the Yaesu, solder wires to two different points
: (what are these), and then feed these to the TNC. Is this information
: correct? If anyone can give an idiot directions, please respond by
: e-mail. Thanks in advance.

The data jack is the correct place to connect up a tnc or other modem
to the 736r. It is already connected ahead of any filtering on receive and
after any on transmit.

To work properly you will need to transmit data via a mini-stereo headphone
plug and push to talk via an rca plug.

It's well documented in the manual.

Geoff.

I will be setting up a full TCP/IP radio network here in the Philippines for universities and research institutions. The system will cover mountainous areas , and will even cross bodies of water.

I intend to use TEKK xcvrs and gracilis or pi2 cards for the end nodes. I am still scouting for 50watt UHF (430 - 470) commercial transceivers (PIN diode switched) (non-surplus) that can be used for 9600 baud. It will be used as mountaintop repeaters. I am looking for commercial (ICOM, KENWOOD, YAESU etc.) xcvrs that will require minimal modifications, but will provide reliable performance at 9600.

Can anybody help me on this? Info on distributors or vendors will be greatly appreciated. Advice on hardware matters will also be very welcome.

the HDLC bit-stuffing is done to break up "flag" patterns (01111110, 0x7e)
in the data. as such, it only works on streams of "1" bits. clock recovery
is a lower-level issue in the HDLC scheme of things.

>Personally, it seems silly NOT to use the scramblers.

ya, scramblers are Good. the GRAPES modem uses one; i would be very
surprised to learn that the 9600 or 19200 modems do not.

Has anyone gotten APRS to run in an OS/2 DOS Box. (I assume that there's no OS/2 version of APRS) I can get it to start, but the graphics seem to write over other graphics instead of clearing the screen first. This doesn't happen all the time, but it happens enough so I get confused. :) Once I get APRS running ok in the OS/2 DOS Box, I'd like to find a way for APRS to get the info it needs from a second OS/2 DOS Box running TCP/IP. The DOS Box running TCP/IP controls a couple of TNCs and has an ethernet link to a seperate machine with additional TNCs. I'm hoping that I'll be able to look at my APRS 'window' and see info that the TCP/IP system has heard on it's radios. If anyone can help, please let me know. Thanks.

```
Release Notes - IM/Mac 1.0b28e

- Added eWorld e-mail address.

- Delete of sent outbound message no longer produces a fatal error.

- Updating of the Outbound Mail window was wrong when opening a
message that was already sent by NET/Mac.

- Reorganized AppleScript suites.

- When an 'alias' file was created for a new IM/Mac-user a mail loop
was created because '<user><tab><tab><user>@<host>' was put in the
file. Sending mail to yourself resulted in an endless try of
NET/Mac to deliver the mail. Changed into
'_<user>_<tab><tab><user>@<host>'.

- Solved date problem in Inbound Mail window.

- Added ISO 8859-1 transliterate table.

The G3RUH/K9NG modems use a 17 bit LFSR scrambler with a scrambling
polynomial of 1+X12+X17. This is a simple one tap maximal length
scrambler. But this doesn't negate the need for DC response in the
modulator and demodulator for good clock recovery. The proto-clock
signal is derived from a zero crossing detector. Remember this is
direct FSK modulation, so if the radio system doesn't have a response
around zero shift, the ZCD will deliver a proto-clock with a lot of
jitter, and that will give you a hunting PLL clock that won't generate
the sample pulses precisely in the center of the eye. That in turn will
lead to a high BER. You don't want a notch in the response centered
around zero shift, and that's what you get with PM modulators and
ratio detectors, or with capacitor coupled input or output stages.
So you need radios with direct FM modulators and discriminator
demodulators that are DC coupled to the modem.

I tried converting the TM401, 440 version to 9600 packet. It won't work without a major effort, because the PLL is closely coupled with the varactor. This causes the low frequency components of the modem's signal (<50hz) to be cancelled out on long packets. I explored an alternate technique called "two-point modulation" wherein you modulate both the varactor in the VCO and the master reference oscillator of the PLL. In this manner, the PLL never senses a freq. drift, and therefor the signal is transmitted undistorted. Based on the effort required, I decided not to complete the project, as the radio just wasn't worth the effort. With TEKK radios going for about $100 9600 ready out of the box, one can't justify much effort on a so-so radio to start out with.

If you're really determined to make *this* radio work, I'll try to help. (BTW, the TM201 and TM401 are identical designs). Let me know how you want to proceed.

The current generations of so-called '9600bd ready' boxes is'nt.

Unless you want to buy the allmode boxes like IC820, FT736, TM455.. but
the FM mobile transceivers all use VCO modulation, and are therefore
(and because the turnaround times are too large) not usable for 9600bd operation

You may check out the new AZDEN transceiver which is advertised in QST
(dec 94, pg 177). It seems they know wat is important for 9600bd packet.

Good hunting,
Joop, PE1DNA

I've been playing with APRS V62B for a day or two now. It really looks like it's got some neat possibilites but it also looks like it wants to use a dedicated TNC in Terminal Mode. Does anyone know how you can interface APRS to a BPQ switch, KISS Mode TNC or something other than a dedicated TNC? Could you have APRS take it's input/updates from a file instead of a TNC?
I'd really like to find a way for JNOS to route APRS info to the APRS program via a null modem cable or file. My JNOS box has 4 radios/tncs and routing APRS traffic that it hears to the APRS system should be do-able. If anyone has any info, please let me know. Thanks.

4996. Linux/AX.25 - which versions work together?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-28 05:56:39 UTC
From: tdonahue@PROBLEM_WITH_INEWS_DOMAIN_FILE
Message-ID: <3dqumn$j38@news-2.csn.net>
Source record: 45593

Has anyone gotten arp/axarp/axaddarp/etc to work correctly with Linux and the AX.25 drivers on sunacm.swan.ac.uk? I'm currently using Linux 1.1.59 from the latest Slackware release and version 026 AX25 kernel patches from sunacm (although I sequentially tried every available rev from 017 on) - no luck.

The arp table seems to be permanently empty (except for Ethernet addresses, which work correctly). It isn't being updated as AX25/IP stations try to connect to me. When I try to enter an address/call manually, the axaddarp command doesn't indicate any error, but immediately afterward, an axarp still shows no AX25 entries in the arp table. As a result, ping, call, and mheard work fine, but no TCP applications do.

Can anyone recommend a working combination of a Linux kernel >= 1.1.59 and *any* rev of the AX.25 drivers?

Thanks,

Tom, KF0JC

From: VK2YQA@vk2djg.une.EDU.AU
Message-ID: <6110@vk2djg.une.edu.au>
Source record: 45682

Gidday,

We are having a number of problems here linking 2 X1J nodes and a number of NOS boxes. (HDX on the same frequency mind you) We want them to work with IP and Netrom traffic but at the moment find straight digipeating much faster!

I have the documentation that comes with X1J but what I'd really like is a dump of the working parameters of a node near you. The items I want to capture are;

parm mtu ipstat mode arp ip ipbroad stats

We are seriously considering dumping these nodes for NOS machines but one of the sites is a solar one.

Only send me data if your node passes IP packets as well as Netrom.

Any other thoughts would also be appreciated.

Many thanks

Nope. Not geosynchronous orbits, either.

> The GPS receivers receive
> data/signals from multiple satellites and based on signal strength,
> determine the location of the receiver in latitude, longitude and
> altitude. Is that close?

Sort of. Based on the calculated position of the satellites, and the time it takes for the signal from each bird to reach the receiver, you can calculate your position. Signal strength isn't used.

> If so... does anyone know more details like what freqs. the GPS stuff
> broadcast on... if it's continuous, how/if the data is encoded, etc.
> Thanks.

Frequency for the civilian part of the system is around 1575 MHz.
The system uses a constellation of satellites, with 24 active, and a number of hot spares. Continuous coverage over most of the planet.

The accuracy of the civilian part of the system has limited accuracy, and its accuracy can be further degraded through a "feature" known as SA, or "selective availability". The military portion of the system gives far more accurate results, and uses encrypted transmissions.

Check out sci.geo.satellite-nav and its faq. Much good info. If you're connecting a computer to a commercial GPS receiver, most likely you'll be using the NMEA-0183 communications protocol. Some anonymous person posted a COMPLETE copy of this spec to sci.geo.satellite-nav recently, much to the disgust of the folks that sell the aforementioned spec for $$.

Besides being good for position and nav info, GPS also provides accurate time info, as the birds carry their own atomic clocks (at least block II birds).

Cheers-

5000. How does GPS work?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-28 13:57:30 UTC
From: kf5mg@kf5mg.ampr.org
Message-ID: <3drqsa$f25@feenix.metronet.com>
Source record: 45688

I know/think/assume that GPS receivers receive signals from GPS satellites stationed in Geosyncronus orbit. The GPS receivers receive data/signals from multiple satellites and based on signal strength, determine the location of the receiver in latitude, longitude and altitude. Is that close?
If so... does anyone know more details like what freqs. the GPS stuff broadcast on... if it's continuous, how/if the data is encoded, etc.
Thanks.

GPS doesn't work on signal strength, it works on relative time of reception
of the various satellite signals. They are spread spectrum signals, around
1200 and 1500 mHz. The exact frequencies have been published, and I
used to see Keplerian data for the satellites somewhere, but not very
recently. I would love to know what power they are, whether stabilized
and what kind of radiation pattern.

I am still scouting for 50watt UHF (430 - 470) commercial transceivers (PIN diode switched) (non-surplus) that can be used for 9600 baud. It will be used as mountaintop repeaters. I am looking for commercial (ICOM, KENWOOD, YAESU etc.) xcvrs that will require minimal modifications, but will provide reliable performance at 9600.
>
>Can anybody help me on this? Info on distributors or vendors will be greatly appreciated. Advice on hardware matters will also be very welcome.

I don't think you'll have much luck with the big commercial vendors. They haven't quite gotten their act together on this yet. Kantronics sells the D4-10, a 10 watt diode switched transceiver that is designed specially for data. To get 50 watts, you'll likely need a fast switching external amplifier. A better antenna may be the preferred route. A repeater doesn't need a lot of power if it's in a good location with a good antenna. Even the TEKK radio would work at the repeater site if you put a tight set of filters in front of it. (That's probably mandatory with any radio at repeater sites shared with other equipment.) Remember, you don't want an alligator, all mouth and no ears, you want a balanced system. It does little good to have the repeater run more power than the user radios it has to hear.

>altitude. Is that close?

No, that's not even in the same ballpark. There are 24 active GPS satellites in medium Earth orbit (abt 900 km). The orbits are roughly polar. The receivers don't use signal strength to determine their location. They use atomic time signals broadcast from the satellites in conjunction with a satellite epidermis downloaded at startup from the satellites. By comparing the time of arrival of a "tick" with the atomic time, the receiver can calculate the distance to the satellite. Knowing it's orbital position at that time, a line of position can be calculated. Given at least 3 satellites, 3 intersecting lines of position can be calculated, and the intersection is then solved, which is the location on the Earth of the receiver. With 4 satellite LOPS, altitude can also be determined.

> If so... does anyone know more details like what freqs. the GPS stuff
>broadcast on... if it's continuous, how/if the data is encoded, etc.

It's a SS emission in two bands, the 1.5 GHz and 1.8 GHz bands. Civilian receivers only use the lower band, and due to deliberately introduced dither in the signal, get a degraded position fix. Military receivers receive both bands, and use the encrypted signals in the upper band to achieve precise fixes.

The newsgroup sci.geo.nav has all the dope on GPS.

From: n3odx@aol.com
Message-ID: <3ds2hd$8t2@newsbf02.news.aol.com>
Source record: 45598

Hello!

I am interested in getting into higher speed (9600 baud) packet. I currently use a Yaesu FT-5100 for 1200 baud operation. I have heard that this radio is capable of higher packet speeds via the packet connection on the rear panel.

Does anyone know what I would need to do (modifications, etc.) to "upgrade" the radio to higher speeds?

Thanks in advance!

: Tom, KF0JC

I use 1.1.55 with AX25.026, and everything works very well so far.
I have recompiled arp with AX.25 support from net-tools-1.1.46.

If only the arp program is the problem, then 'cat /proc/net/arp' should
display the ARP table correctly.
If this doesn't work either, you have a problem with your kernel - maybe
you should have a look at your ifconfig?

Hope this helps...

Klaus,

Thanks very much for the info. Although axarp and arp failed to show
any ax25 arp table entries, the cat did. After adding some ax25
entries, TCP applications worked! (but intermittently)

I'll give net-tools-1.1.46 a try.

When I first started reading your reply Barry, I thought you were missing the point I was trying to make. But as I read further I see that you do understand. That was a very eloquaint reply and I applaud you. This is the reason why I have been experimenting with Linux & AX.25 to get Mosaic to run over 9600 bps packet modems. Yes we need faster modems and they will come in time. They require a great deal of technically knowledge and I know there are several engineers working on this very problem. The trouble is amateur packet radio is a hobby and each of them has a day job.

I wasn't trying to say that you were breaking type acceptance. I was warning anyone doing as you orginally described wholesale that you will be violating part 97. I doubt that the spreading code used in these part 15 devices is one of the three allowed amateurs. Thus this is the stumbling point, not the adding of an amp nor the adding of a yagi antenna.

My suggesting is don't bog yourself down with the "I want to do Mosaic over packet but I don't have ISDN speeds yet" mind set. We do have 56K and we can do Mosaic. I'm doing Mosaic now using 9600 bps packet. We need to set these stations up now and show them to our fellow hams, then they will see that packet does have potential. Then the higher speed modems will come.

Steve N7HPR (srbible@cs.nps.navy.mil)

5021. HELP: Attaching ARCNET cards with JNOS

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-29 06:18:31 UTC
From: jwsnyder@email.unc.edu
Message-ID: <jwsnyder.788681911@email.unc.edu>
Source record: 45614

I have recently procured two working 8-bit arcnet cards which I would like to use to link my 486 and my 8088 XT (the latter being my primary NOS machine) I am able to link the two via a 4800 baud SLIP link, but I am looking for some improvement in speed as well as avoiding the inconvenience of having to give up the use of my modem in order to run the SLIP link.

Here's basically the problem: One of the cards is a SMC PC130 and the other is an SMC-compatable for a star network. I generated an IPX.COM file for the 130 using Novell WSGEN and installed it prior to invoking NOS. When I tried to run the "attach" command, supplying, of course, the interrupt address, JNOS responded that no packet driver was available at that interrupt. Can anyone provide some techinical assistance on getting JNOS to recognize and attach these network cards so that I can run a simple 2-node ARCNET? (Currently using JNOS v1.10x15).

Thank you for any help anyone may be able to provide.

Sincerely,
Will Snyder / KB4LFD

Here is my $0.02 worth from what I've read about GPS:

The GPS sats are in low-earth-orbit and transmit a spread-spectrum,
omni-directional signal, at (I believe) 40 watts!. All the satellites
transmit on the same band with different pseudo-random sequences to
differentiate them. With this technique, a single wide-band receiver
can receive all the signals which are compared to seperate psuedo-random
comparaters to seperate the individual sats.

Each satellite has an atomic clock so the time of transmittion of each
signal is known so by using four satellites simultaniously, the reciever
can figure out latitude, longitude, altitude and time.

The data sent contains orbital information that the receiver needs to
figure out where the satellites where when the signal was sent.

The government degrades the performance of the GPS system by jittering
the send time (I imagine using another psuedo-random sequence) and/or
by sending slightly incorrect orbital elements. By using two receivers
that are close to each other, however, you can obtain a *VERY* accurate
distance measurement between them -- like a couple of centimeters.

: > voice radio, has anyone considered a way how to use this technology for
: > amateur use?

: Unfortunatly it's not too practical. An assumption of a telephone
: is that a full-duplex circuit exists. That way the modems can interact
: to establish the equalization needed to operate at that speed over a
: voice-grade circuit.

Assumption is the mother of all screwups. In this case, the assumptions are:
1. the radio circuit is full duplex
2. the modem in question is a modern V.32 or V.32bis.

V.29 is a half duplex standard that is directly supported by some
(not all) of the modern V.32 modems in that it's the basis for
FAX transmission. It meets all my basic requirements for radio
data comm:
1. Half duplex (2 wire).
2. Adaptive equalizer can be disarmed or preset.
3. Baud rate fall back for crummy paths.
4. Ossified in standards.
5. Can be crammed down a voice grade (2.7Khz) wide channel.
6. Does not require frequency response to DC.
7. Scrambler to reduce peak channel power and improve C/N ratio.

*** V.29 *****
CCITT standard for 9,600 bits per second modem for use on point-to-point
leased circuits. Virtually all 9,600 bps leased line modems adhere to this
standard. V.29 uses a carrier frequency of 1700 Hz which is varied in both
phase and amplitude. V.29 also provides fallback rates of 4800 and 7200
bps. V.29 can be full-duplex on 4-wire leased circuits, or half-duplex on
two-wire and dial-up circuits. V.29 is the modulation technique used in
Group 3 fax for image transfer at 7200 and 9600bps.

The modulation is 8 phase, 4 aplitude quadrature amplitude modulation.
I've been using V.29 modems for 4wire lease line circuits to run
statistical multiplexers for about 10 years. Nobody seems to want
them. I pay about $10/ea for this late 1970's technology. The only
butchery required was shortening the carrier detect delay and adding
a one-shot to the RTS for transmit keying. I had a marginally working
setup running for about a week until I had to install the system.
I was running an 8 port stat mux over a 49Mhz cordless phone link
without too many suprises. The biggest problem I had was dealing

with the synchronous clock. It would lock in 15ms but had to go through both modems twice before the orignating modem was convinced that it had a valid clock signal. Added to the TXDELAY, the total transmit delay was about 600msec which is exessive. I also had to do some creative wiring to seperate the tx and rx audio and still maintain half-duplex operation. Half-duplex is normally a 2-wire circuit instead of a 4-wire (full duplex) circuit.

Before anyone proclaims this as the new 9600 baud packet radio standard, please consider that V.29 does NOT offer any real benifits over G3RUH style 9600 baud packet. It is also more complicated, more expensive, and NOT easily available in V.32bis modems. If you want to try it, be sure to get the complete command set for your V.32bis modem's chip set. The modem manuals list only a subset of the available commands. For example, the full command summary for my Supra 144LC modem is 1100 lines long (available on their bbs). Since the phone lines are basically 300-2700Hz, you can probably just cram the audio into the microphone and speaker for tolerable results. Also, tell us if it works.

Drivel: Did you know that AT%T will turn a USR Courier or Sportster modem into a touch-tone to ascii decoder? Even the ancient 2400 baud Courier's have this feature.

|> but it doesn't seem to work. Thanks.

My advice to software developers: Give the user the ability
to specify ANY serial port address and IRQ. Programs like Telix
do this, and when you need it, you need it bad.

Another.... faster.... alternative would be to pick up an NE2000 and NE1000 clone cards. Locally they can be purchased for about $30 each (new). Two of those (thin-net) and $10 worth of cable and you've got a 10 Mbit link.

With either the NEx000 card or the Arcnet card... you need a packet driver to talk to nos. When you load the packet driver, it will use a 'virtual' Interrupt 0x60 - 0x64 (or so). In your attach statement in NOS, you'll supply the virtual interupt for NOS to use. I'm not sure if the IPX.COM and WSGEN programs give you a FTP Packet Driver or not. pc.usl.edu has a .zip file with tons of packet drivers. I'm almost positive that there were arc-net card packet drivers in there. Look for a pktdrvr directory or file. GL.

I haven't looked into this much, but I should, since I my 432 antennas
100feet away from the shack can hear my 486 computer quite well.

What about threading your cables through toroids or using
split ring material for clamping over the cables.

There are also flat pieces of ferrite for clampling on flat
cable that I've seen too.

If you fix it, let us know how you did it.

My friend and I are wrking on setting up the current Slackware
release of Linux (1.1.59) with AX25 drivers. We have been using
AX25026 from swan.uk, and it compiles. Now:

is AX25026 the right cource for kernel 1.1.59?
axattach, ifconfig seem to work fine, but listen gives nothing. what gives?
We have a Linux 1.1.31 kernel pre-built with ax25 - Are we better off
using that? I hope not.

Thanks for listening!

It seems to me that 3 satellites can solve for position (including altitude)
while 4 satellites can solve for time as well.

I suppose in a more general sense, more satellites give more accuracy,
but mathematically, you should be able to determine your altitude from
just three satellites, assuming you don't know what time it is (e.g. have
your own atomic clock.)

I believe that there is no pot for deviation adjustment in the KPC-3 but
AFSK level output is adjusted by Jumper 3, on being high and off being
low. You would have to adjust the deviation from within the rig to get
true FM deviation levels. I stand to be corrected though.

Does anyone have any experience using these? Any comments on the claimed operating distance, or advice on replacement aerials to make them perform better? What about data throughput?

Any comments greatly appreciated as I plan to use these in a data transfer application....

I haven't seen any and don't expect to see any free or shareware software
just yet. Here's why. It is my understanding that the protocol is
considered proprietary by the authors, even though most of the specs
have been published. I am pretty sure that the authors are asking
for a cut of sales of software incorporating the pactor protocol.
This probably precludes free software from using pactor and may
limit the shareware, depending on the attitudes of the authors.

The above statement is just my impression of the state of affairs after
reading various posts and articles, so it could be entirely wrong, so
please don't flame me if you know something I haven't included.

73 and Happy New Year!
Jim.

What!? You mean the cell-phones do NOT receive the cellular band right
outta the box?? ;-))) Hope the thing's still under warranty. ;-))

This past summer, Nuts & Volts magazine (I forget wich issue) had an article
containing the test modes and low-level programming commands for Motorola
AMPS MC^2 series flip-phones. Among these, were commands to specify a
cellular channel which the phone would then monitor. There was, however,
no "scanning" function to search for and stop on active channels.

At a recent radio club meeting on packet, a number of folks brought in
portable packet stations. Two very portable ones of note- one was a HP 100
handheld, the other a Newton.

I've used my Newton with a KPC-3 and a terminal program on packet. Data
entry is a pain, but it works well monitoring the local DX cluster. With
this setup, RX/TX power is the big problem- the TNC (KPC-3) and terminal
(Newton) will run for a long time.

I've got a Timewave DSP-59+ connected to my TS440. Use it mainly for
HF, particularly pactor. Very useful- the only problem I have is remembering
to turn off the Tone filter before going to Pactor.

Yes, but you don't. One of the quantities you are solving for is the
time offset of your local clock from the atomic clocks on the spacecraft.
So 3 satellites allow you to solve for time, longitude, and latitude.
With 4, you can also solve for altitude.

: We have a Linux 1.1.31 kernel pre-built with ax25 - Are we better off
: using that? I hope not.

Pete,

Those two revs (sort of) worked for me. Make sure you recompile the
ax25utils. The binaries that came in the tar file didn't work for me.
Actually, the axarp command still didn't work after I recompiled it,
but everything else, including listen did. BTW, you have to be root
to run listen (maybe this was your problem all along).

I tried 026 with 1.1.74. It didn't fix the axarp problem, and it
added the inconvenience of having to be root to run call (I could run
it as a normal user under 1.1.59). I'd stick with 1.1.59 if I were
you.

Call, listen, ping, and mheard work perfectly. I'm still only able to
use telnet, sendmail, and other TCP applications intermittently. They
work about one out of every three or four tries. Monitoring with
listen while trying to connect, shows that the destination host
replies the same way each time - very strange. I suspect that some
TCP timers need to be tweaked in the kernel somewhere.

Good luck and 73,

Tom, KF0JC

Hi,

There are no geosyncronus GPS satellites. The constilation of GPS satellites are all low orbit. To get Lat, Lon, and altitude you need to be receiving signals from 4 healthy satellites. You can get lat and Lon from 3 of them.

When more than 4 satellites are in view your receiver knows where they are and selects the ones that are widely spaced to give you the most accurate information. It is not done based on signal strength.

The satellites broadcast continuously. The signal is spread spectrum. You will not be able to hear it with a normal receiver.

The frequency for the CA mode transmission is 1500 plus MHz. I don't remember the exact frequency.

Hope that helps.

Bill

My mistake, yes there is a pot that varies the output of the AFSK in
conjunction with the jumper 3. On two pins, the pot goes from 140
millivolts to 4 volts peak to peak and with the jumper off it goes from 2
millivolts to 60 millivolts peak to peak. This from the manual. The pot
is R 13.

You may be right. Just what is the limits of low earth orbit? I have
been using the term to mean "below geostationary orbit" but that
might not be correct. Are there satellites in "high earth orbit"?

> Mick
> (ac6eu)

That is one of the things I find really clever about the GPS system --
although it uses time differences to calculate distance from the
satellite, you don't need to lug an atomic clock around to find
out what time it is. You just need a clock that is accurate for
whatever time it takes to receive all the signals (a few seconds?)

The other neat thing is the use of spread-spectrum to allow all
the satellites to use the same band at the same time.

Although you only need 4 sats to determine position theoretically,
I think most receivers warn you if they don't have at least 5.

(trimmed)
: Remember this is
: direct FSK modulation, so if the radio system doesn't have a response
: around zero shift, the ZCD will deliver a proto-clock with a lot of
: jitter, and that will give you a hunting PLL clock that won't generate
: the sample pulses precisely in the center of the eye. That in turn will
: lead to a high BER.

Given sufficient time, the PLL will extract a usable clock signal.
This is not reasonable with a packetized signal that requires almost
instantaneous lock times. The reasons for using scrambling are:

1. Reduction in *PEAK* power within the channel bandwidth (by
spreading the power over the entire channel) thereby reducing
the required dynamic range of all the analog gizmos thrown into
the signal path. This is why all phone line modems 1200 baud
and above have scramblers. (Detailed explanation if anyone wants it.)

2. Elimination of single frequency "tones" in the channel bandwidth
which may result in crosstalk to adjacent channels. This is a real
problem in multiplexed radios. [It is NOT a ham consideration unless
9600+ baud packet radio gets very popular]. This is also why modulation
schemes that intentionally concentrate all the power into a narrow
frequency band (Manchester Coding) are un-popular with the mux mob.

3. Speed of lockup should not be dependent upon any long term averaging
or long word digestion scheme. A scrambled signal can be assumed to
have a symmetrical power density (equal amounts of power above and below
centre frequency). Therefore a data slicer or PLL will not waste its
time hunting for a center value and start belching bits almost immediately.
Note that you do NOT need to be sending data with a scrambled signal
to start the locking process and extract the clock, while a
non-scrambled signal will (usually) require data to begin locking.

This appeared on the FCC's web server. Guess they must consider TCP/IP, which has been operating on the ham bands for something like 9 years now, to be a "future system" they'll worry about later.

I heard Johnny Johnston and Bill Cross say at the Dayton FCC forum that the Commission really wanted to set amateur rules that didn't need constant revision to adapt to changing technology. Guess they changed their minds.

--Phil

Report No. DC-2700 ACTION IN DOCKET CASE December 29, 1994

COMMISSION DENIES RECONSIDERATION OF ORDER CONCERNING MESSAGE FORWARDING SYSTEMS IN THE AMATEUR SERVICE
(PR DOCKET NO. 93-85)

The Commission has denied Phil Karn reconsideration of its decision concerning message forwarding systems in the Amateur Service. Karn sought reconsideration of the Commission's decision that requires the licensee of the forwarding station to either authenticate the identity of the station from which its accepts communications on behalf of the system, or accept accountability for the content of the message.

On March 30, 1994, the FCC adopted an Order which provided that in contemporary message forwarding systems, the control operators of intermediate forwarding stations, other than the first forwarding station, would not be held accountable when their stations retransmitted improper communications inadvertently. The purpose of the Order was to relax the amateur service rules to enable these systems to operate at high speed while retaining the minimum safeguards necessary to prevent misuse.

Denying reconsideration, the Commission said the Order did not address, nor was it intended to address, what accommodations should be made for message forwarding systems that may be developed in the future. This issue appeared to be the main concern of Karn's request for reconsideration. The Commission said that if the present accommodation becomes unworkable in a system using a different architecture, the manages of that system can request necessary rule changes at the appropriate time.

Action by the Commission December 23, 1994, by Memorandum Opinion and Order (FCC 94-344). Chairman Hundt, Commissioners Quello, Barrett, Ness, and Chong.

|> modulator and demodulator for good clock recovery.

Gary is quite right. A scrambler only gets rid of the discrete spectral lines that occur in non-random data. It doesn't change the spectral density function, which for NRZ (and probably NRZI) is maximum near DC. So even with scrambling you still get baseline wander in an AC-coupled channel.

|> That is one of the things I find really clever about the GPS system --
|> although it uses time differences to calculate distance from the
|> satellite, you don't need to lug an atomic clock around to find
|> out what time it is. You just need a clock that is accurate for
|> whatever time it takes to receive all the signals (a few seconds?)

Right. And you *must* solve for time as one of your unknowns if you expect any accuracy at all. Since the speed of light is about 300 meters/microsecond, you'd need a local clock accurate to a microsecond to get this kind of accuracy in your range measurements. That not being possible for most receivers, you make time one of your unknowns.

GPS's requirement for precise timing has made it the preferred way to get accurate time. Many GPS receivers are designed to operate in fixed locations for just this purpose. Once it knows its own location, it needs only 1 satellite to provide good timing.

You *can* still make use of 3 satellites for position location by getting rid of another unknown, namely altitude. Most receivers will give you a "2D" fix with only 3 satellites by assuming a known altitude. This can be entered externally to some receivers, while on others it will use the altitude determined from the last 4-satellite (3D) fix, and on others still it will default to sea level. This last approach is common on marine units like my Icom GP-22, which can produce some nasty errors when used in places like Colorado.

So what's the next step Phil? Any suggestions?

If hams have to authenticate identities, any indication as to how
good the authentication has to be? Are there reasonable steps
we could take that, if not perfect, would satisfy the bureaucrats?

If this has already been covered, my apologies.

Hi Greg,

If you're willing to settle for analog, but pretty much ready to plug
and play, there is a company that offers a package to accomplish this
end. I don't have a copy of the magazine at hand, but in 'Home Power'
magazine a company was advertising such a system. The magazine caters
to those that live out of reach of wired power and communications, so is
a great resource for these types of needs.

Hope that helps!

Bob

Source record: 45571

Perhaps this is not the best place to post this, but I don't know of a better place. My father is a Ham radio operator, W8JLW, and lives in Westchester Ohio. He is active in a "net" of folks who relay messages over Ham radio, and every evening at a specified time, he takes part in this activity. He is blind, and this activity is very pleasurable to him, as he doesn't leave the house. I was wondering if someone knew of an internet address whereby I could send him messages via the internet, and he could have them read to him. I understand that packet radio networks are used to relay these messages around the world, so I'm sure that there must be someone in Cincinatti Ohio who has access to both the internet and the packet radio network. Any advice or suggestion would be greatly appreciated. Thanks, Richard Dillon, SAICRD@sam.neosoft.com

Call Yaesu and ask them to FAX (or mail) the information to you. I used
to have access to it but am not employed in the amateur packet business
any more. Also, if you may want to consider a wider RX IF filter.
Yaesu has information on these also, including part numbers an prices of
options they have available. Just don't bother with the data jack when
it comes to 9600 baud packet. It'd be plug but don't play.

If the modifications simply 'tap into' a circuit to bring out
connections for 9600 packet, then other functions of the radio should
not be affected. If you have to open circuits, this will probably
prevent the radio from being used for normal voice communications.

If you are indeed planning full-duplex repeaters as part of the system, you will not need T/R switching. The transmitter will relay in real time what the receiver is hearing. To accomplish this will require either a lot of antenna seperation (not recommended) or cavity duplexers to prevent your repeater transmitter from 'desensitizing' the repeaters' receiver. You will likely have to look to Motorola or other similar vendors of data-over-radio products for 9600 baud ready repeater hardware.

Also, pin-diode T/R switching does'nt buy you anything if the radio is synthsized and the synthesizer takes a long time to lock up. Here in the Seattle Washington area, we've had (by far) better luck and performance with surplus GE MVP crystal controlled radios using a mercury wetted relay for antenna T/R than with >any< recent production PLL-equipped and modulated radios. Stock operation has a RX -> TX time of about 60 mSec and a TX -> RX time of about 30 mSec. By changing a couple of capacitors, the RX -> TX time becomes 7 mSec (the relay only takes 3 mSec) and TX -> RX is 4 mSec.

The only radios we've seen that are comparable are the all-mode (SSB/CW/FM) radios, and a couple of synthesized radios that generate their modulation the same way, i.e. use an FM modulator in the TX IF and convert from there to the desired on-air transmit frequency.

Most synthesized transmitters don't have a transmit IF, so have no equivalent modulation point. A lot of these radios take up to (and some times in excess of) 200 mSec to get up on the air, and an equivalent amount of time to get back to receive.

If you're planning a network that will be of a long-term nature, I'd stay away from synthesized radios except for testing and temporary installations. Make sure all the permanent radios realize the rapid

switching times needed to allow the network to perform. And look to the
'data over radio' commercial vendors for the best solutions. Products
designed to voice communications requirements won't make the grade, or
will require extensive skilled modification to work well.

Or design/build your own! That's the way to assure you get exactly what
you want.

Regards, Bob

Hello Bob,

If somebody will get me a copy of the 9600 mods I will at a minimum place
them on my anonymous ftp site here at wb3ffv1.sed.csc.com. I also don't
see any reason why sites like ftp.ucsd.edu or oak.oakland.edu would have
any problems with having the file available. The mods are not all that
big, at least not any I have ever seen.

Please forward a copy of them to me and I will make sure that are available
to other intersted intenetters...

>I will also upload a lot of good stuff re radio mods and medium and
>high-speed packet radio when an ftp site is available!

Well I am glad to see some interest brewing in high speed packet, as I
hope we will see more of it implemented in the future. I guess I take a
moment to mention the hs-modem mailling list that I created many years
ago for just this type of information. It has seen no activity in recent
times, but maybe things are changing. I will leave the information on the
list below, but if interest warrants I will by all means also create a
file area for High Speed Packet Modems on my FTP site which is also
available to the BBS users who dialin to my system. Hopefully this
gives everyone a chance to get to the information. I have an incoming
directory, so feel free to sent high-speed packet stuff to wb3ffv1.sed.csc.com.

Here is the info on the ihs-modem mailling list:

This list was designed to cover the discussion of RF based packet modems
that run at speeds of 9600bps and faster (like the 56Kbps GRAPES modem,
multimegabit microwave modems, and the 9600bps modems by various other
companys). I also have no problem with discussing state of the art dialup
modems (like V.34) on this list though the list is mode HAM oriented, as I
am sure such modems will be used to interconnect radio LAN's.

To submit a message to this list, just send your message to the address:

hs-modem@wb3ffv.ampr.org

To join the HS-Modem mailling list, just send a message to the address of
hs-modem-request@wb3ffv.ampr.org, and in the body of the message just put
subscribe (not the subject line).

PLEASE NOTE: This list is mantained by Majordomo which is an automated
listmantainer. For more help with the Majordomo system
send a message to Majordomo@wb3ffv.ampr.org and in the body
of the message put HELP on it's own line.

Any of the stand-alone TNCs that support RS-232 communications and 1200 baud operations will do the job. And at this point I don't know of any stand-alone TNCs that don't support RS-232 communications.

For software you use the terminal emulator (term) that's in the Model 100, configured to use the serial port rather than the internal modem. The low power and the (as I recall) slow switching time of the micro-2AT will put you at a disatvantage in situations where the channel is busy.

I actually use an IC-2AT (the old original Icom HT) for packet. It's easy on batteries, and has better T/R switching times than many other handytalkies.

For small (and very small) TNCs that will run on batteries, look at Kantronics and Paccom TNCs. With a little care in planning your setup you can get the computer, TNC, radio, spare batteries, cables, pull-up whip antenna, and maybe even the wall supplies into a pistol case.

73, Bob

+---------------------------------------------------------------------------+
HOW TO ACCESS THE WB3FFV AMATEUR RADIO INTERNET BBS !!!

I have placed a BBS system on-line that is mainly oriented towards the
Amateur Community (but there are plenty of other wares on-line). Through
user support I hope to keep the latest and greatest ham software on-line.
The BBS also offers access to nearly all of the Internet (USENET) NetNews
groups, plus access to most Internet services such as Email, FTP, TELNET,
Gopher, WWW, Callsign Lookup, Etc... Below is the information that is
needed in order to access the BBS via Telephone, Telnet, or FTP. Please
pass it around to as many ham's as possible.

System Name: WB3FFV
User Login: bbs

410-661-2475 - 12/24/48/96/14.4/16.8/19.2/21.6/28.8
(V.32bis,V.32terbo,V.34,V.FC,HST,V.42bis)

410-661-2648 - 1200/2400/4800/9600/14400/23000
(MNP2-5, V.32bis, V.42bis, Turbo-PEP)

TELNET/FTP - wb3ffv1.sed.csc.com (20.2.1.80)

Data Settings: 8 Bits, NO Parity, 1 Stop Bit
Times: 24hrs/365days (except for routine maintenance)
Software: UniBoard UNIX BBS Software (Version 1.30b)
Misc. Info: Machine is an Pentium-90/MP running UNIX System V Release 4.2
and features more than 4 Gigabytes of on-line file storage.
Most transfer protocols are available!! (5 phone lines)

I attempt to keep the latest and greatest HAM software on-line, and encourage
all to upload anything new that they come up with, as it is of benefit to all.
Here is a sample of a couple pieces of software that is available for DOWNLOAD:

KA9Q TCP/IP Software for the PC (Latest OFFICIAL release + TEST Versions)
KA9Q TCP/IP for the Atari-ST, MAC, & Amiga
KA9Q TCP/IP for UNIX based systems
KA9Q TCP/IP (The NOS release) [UNIX, MS/DOS, Amiga]
KA9Q TCP/IP (Version by G1EMM, PE1CHL, PA0GRI, Etc.)
N2GTE Packet Message Switch [GTEPMS]
WA7MBL BBS for the PC
W0RLI BBS for the PC
MSYS BBS for the PC running KISS TNC's
AA4RE BBS for the PC (plus BETA versions)
F6FBB BBS for the PC
```

G8BPQ PC-Node (Version 4.08)
Various BBS utilities and enhancements
Several MORSE CODE Tutors
TheNet software by NORD><LINK
Modifications for many HAM Rigs and Scanners
Digital Signal Processing software (DSP)
DX and contesting programs

If you are interested in using UUCP to connect to the BBS, this can also be done as I support Anon-uucp. The login to the system is 'uucpanon', and there is NO password. The listing of avalible archives are stored in a file called 'FILES', and it is located in the /var/spool/uucppublic. To retrieve the files listing just use the following command:

uucp wb3ffv!~/FILES /usr/spool/uucppublic (ASCII Text)
-or-
uucp wb3ffv!~/FILES.Z /usr/spool/uucppublic (16-Bit Compressed)
-or-
uucp wb3ffv!~/FILES.gz /usr/spool/uucppublic (GNU Gzipped)

This will move a copy of my files listing into your uucppublic directory.

If you want to access the BBS via Telnet all you have to do is TELNET to wb3ffv1.sed.csc.com, and login is 'bbs' with no password required. To use anonymous FTP just ftp to wb3ffv1.sed.csc.com and login as 'anonymous'. This system is currently attached to the Internet via a dialup SLIP link, and should generally be available 24hrs, but at times the modem will drop the line. Also since this isn't the fastest link, I will be limiting the maximum number of anonymous sessions for the moment.

If you have any questions or problems, feel free to contact me at one of the numbers/adresses below. Good Luck...

Internet : howardl@wb3ffv.ampr.org | Howard D. Leadmon

5087. DSP-based SINAD 'meter'???

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-12-31 22:06:44 UTC
From: rdonnell@eskimo.com
Message-ID: <qNT1lWml1mZK064yn@eskimo.com>
Source record: 45581

Hello all,

It seems like several months ago I recall a mention of software or source code for a DSP or sound card based SINAD calculator.

I'd like to locate this information both for myself, and because at the company where I work we depend on analog SINAD meters ("Sinadders") to tune and verify that radios we manufacture meet audio distortion and sensitivity specifications.

The analog meters have been an ongoing headache in that their calibration is not stable, and recalibrating is such a tedious and touchy process that the meters have individual 'fudge factor' post-its on them.

It seems like we ought to be able to do better with a DSP-based solution, and I thought I saw it mentioned here. Anyone 'fess up?

Thanks, Happy New Year, and 73

Bob

I doubt if there is any generally accepted definition. My own thought
was that ones with a period of under a couple of hours are certainly
low. Above geostationary would certainly be high, too! I would
suspect with the moon around, it might be pretty hard to keep the
latter in a very useful state. The whole business is pretty marvelous,
anyway. Gerry
